

# Can the U.S. Dominate Energy?

September 7, 2017  
AADE/IADC, Houston Tx.

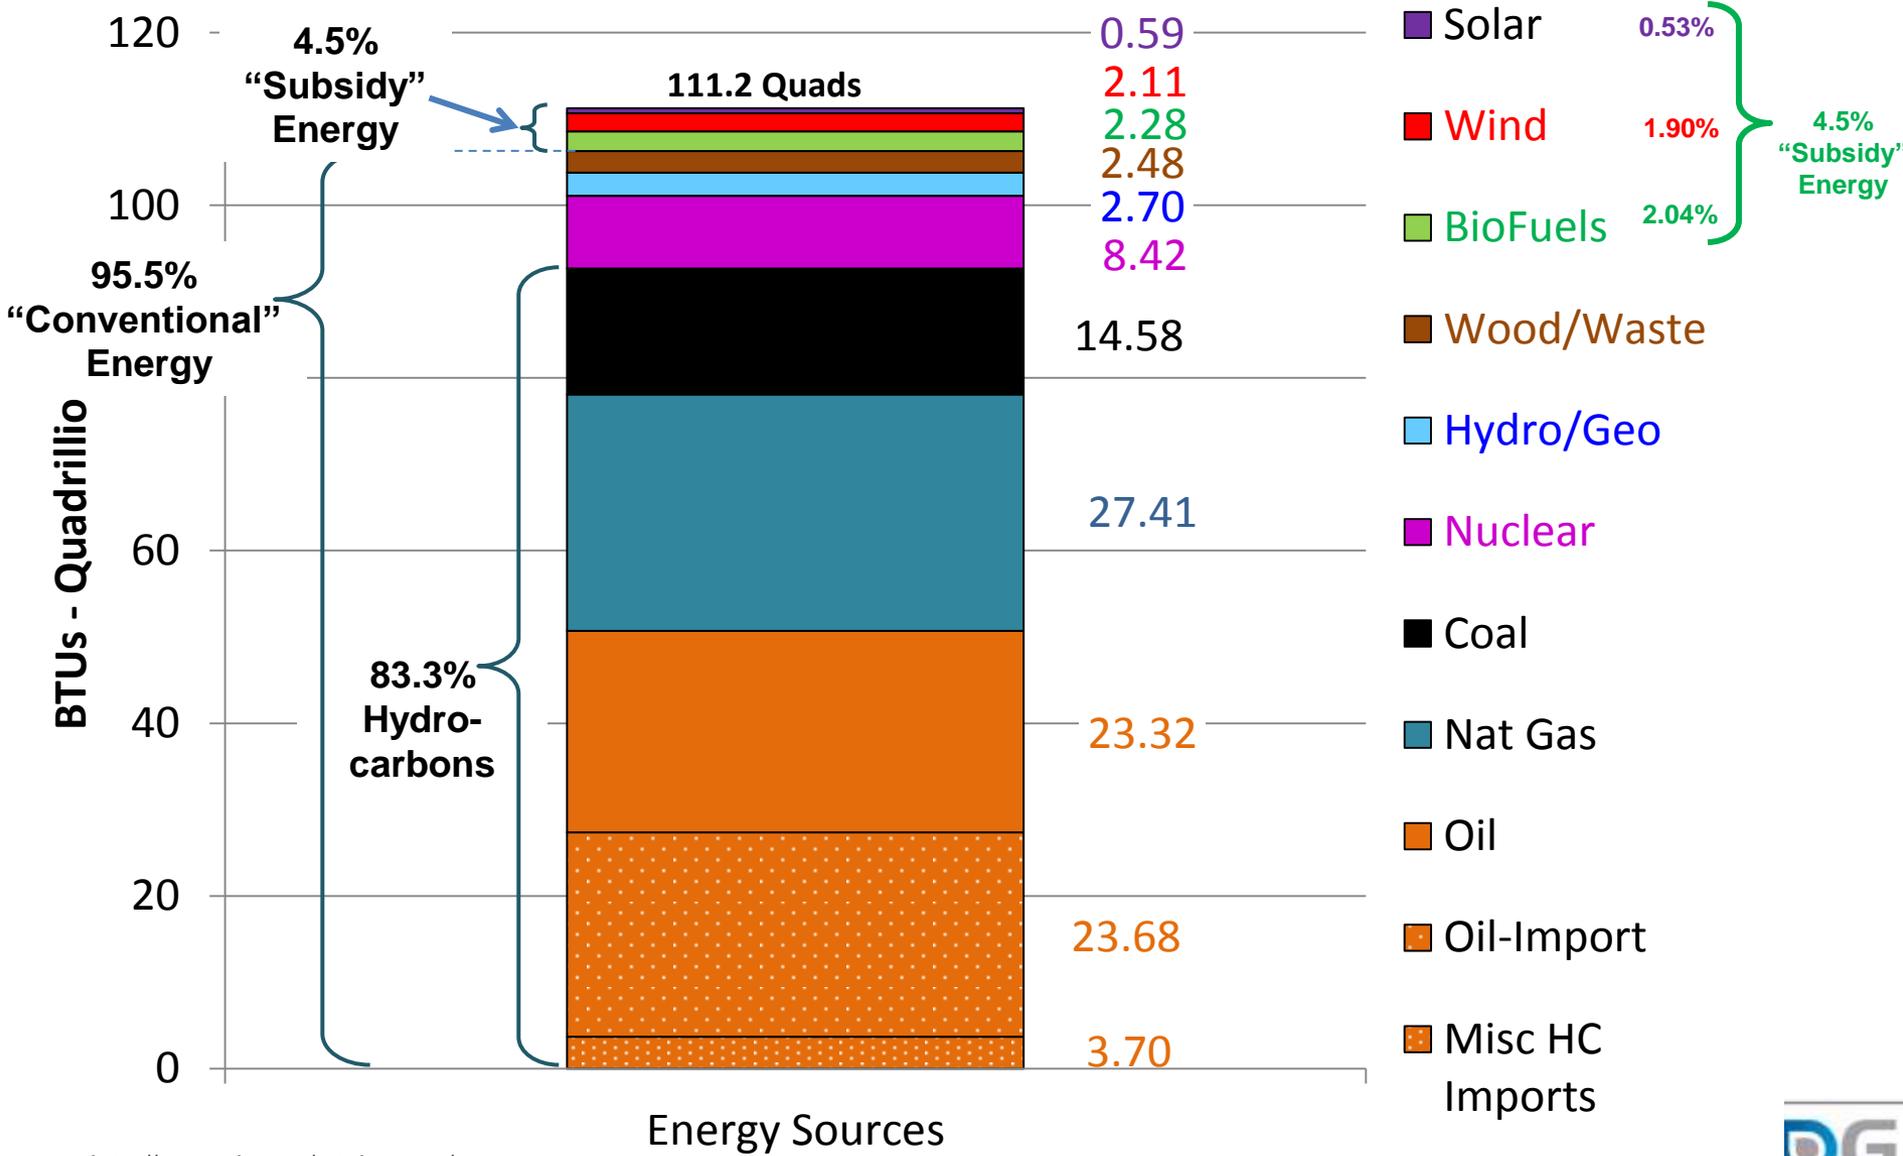

J.M. Leimkuhler  
Vice President Drilling  
LLOG Exploration L.L.C.

# Can the US Dominate Energy?

- ➔ • US Energy Overview – Where do we get our energy, where does energy go?
- Review the Trump Administration’s Energy Goals & Strategy – what does it mean to “DOMINATE” energy?
- SWOT Analysis – Strengths, Weaknesses, Opportunities & Threats - America’s ability to “DOMINATE” energy.
- Answer the question, Can the US dominate Energy?
  - In Depth Look at each sector: Oil, Gas, Coal, Nuclear, & “Renewables” (Hydro/Geo, Bio-Fuels, Wind, Solar)

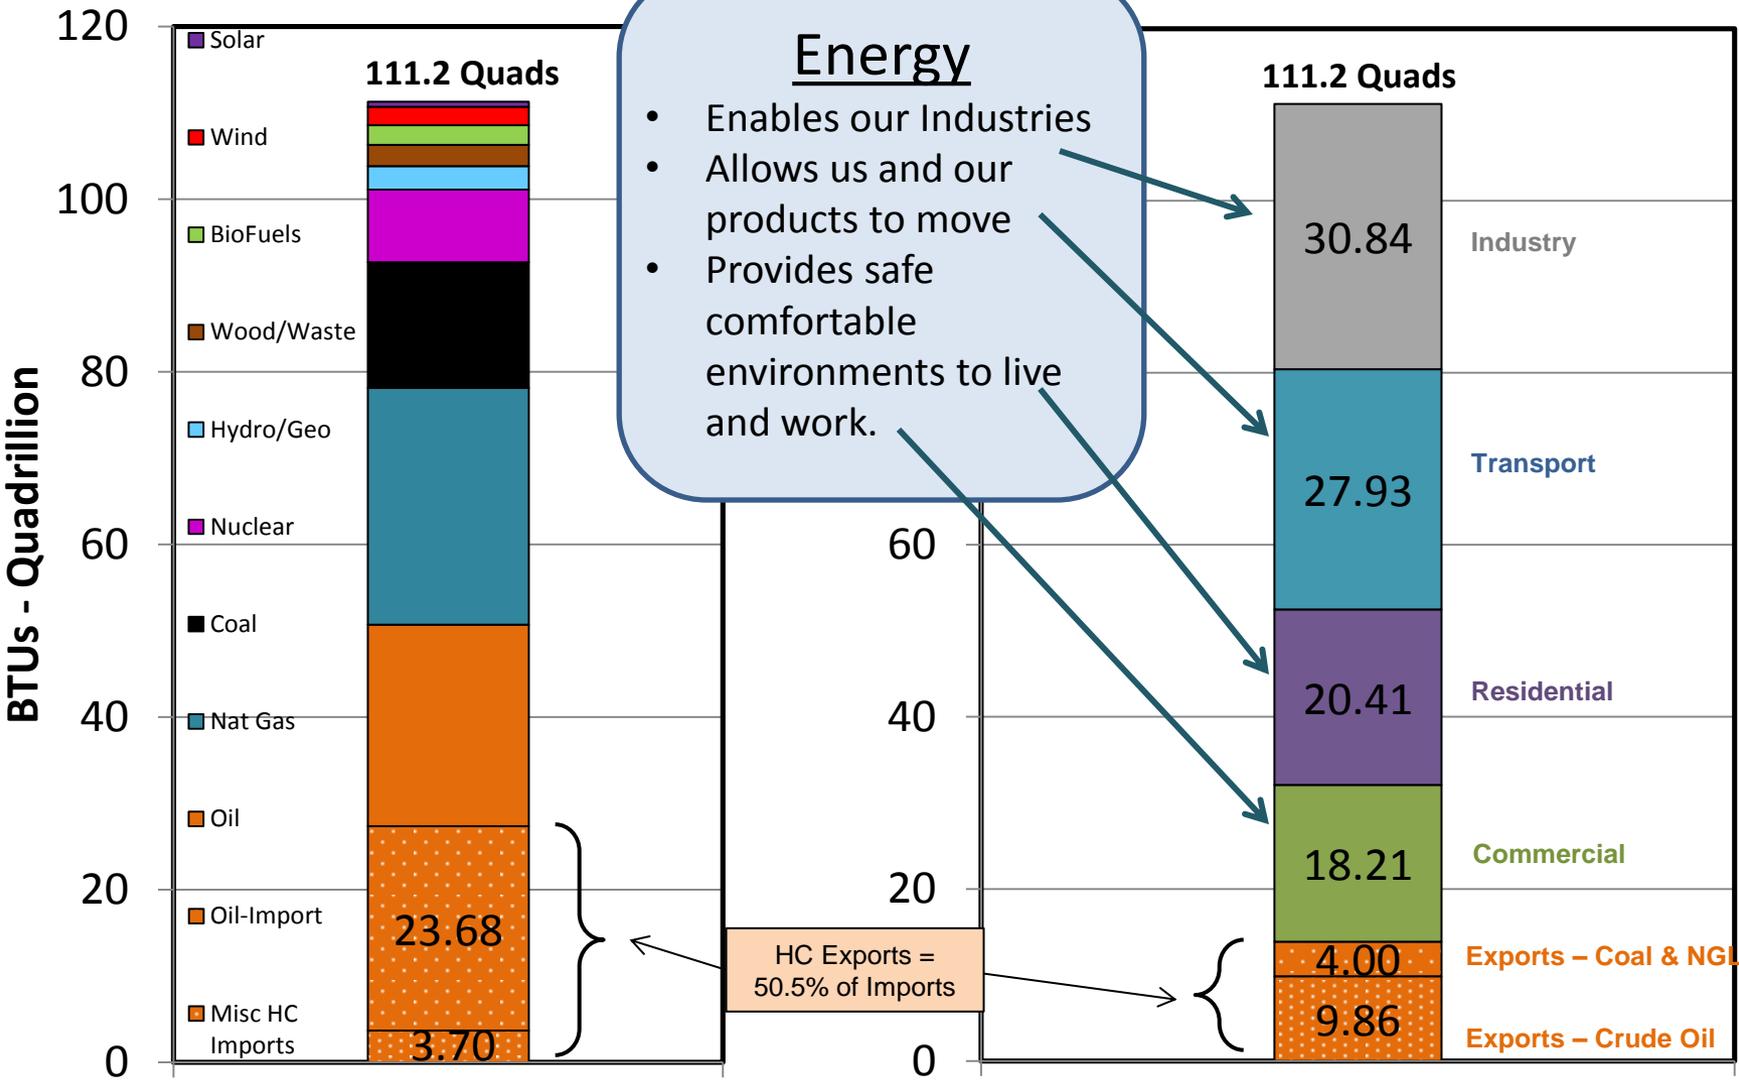

# USA 2016 – Energy Flow - Sources

# USA 2016 – Energy Flow – Sources & Utilization

**Energy**

- Enables our Industries
- Allows us and our products to move
- Provides safe comfortable environments to live and work.

Energy Sources

Energy Utilization

# Can the US Dominate Energy?

- US Energy Overview – Where do we get our energy, where does energy go?
- Review the Trump Administrations Energy Goals & Strategy – to date & what does it mean to “DOMINATE” energy?
- SWOT Analysis – Strengths, Weaknesses, Opportunities & Threats Analysis - an Overview of America’s ability to “DOMINATE” energy.
- Answer the question, Can the US dominate Energy?
  - Look at each sector: Oil, Gas, Coal, Oil, Nuclear, Hydro/Geo, Bio-Fuels, Wind, Solar

# Trump Vision of American Energy Dominance

“We’re here today to usher in a new American energy policy,... not only focusing on “energy independence,” but also “energy dominance.” 6/29/17 Whitehouse.GOV

## Focus Areas:

- First, we will begin to revive and expand our nuclear energy sector...A complete review of U.S. nuclear energy policy will help us find new ways to revitalize this crucial energy resource.
- Second, the Department of the Treasury will address financing barriers for efficient overseas coal plants. Goal – increase US Coal Exports.
- Third, approved construction of a new petroleum pipeline to Mexico, which will further boost American Energy Exports. US crude has qualities attractive to the international market.
- Fourth, globally market American natural gas. DOE approved additional applications to export LNG from Louisiana.

Finally, in order to unlock more energy from the 94 percent of offshore land closed to development under the previous administration, we are creating a new offshore Oil and Gas Leasing program. America will be allowed to access the vast energy wealth located right off our shores.”

*“Our country will no longer be vulnerable to foreign regimes that use energy as an economic weapon; American families will have access to cheaper energy, allowing them to keep more of their hard-earned dollars; and our workers will have access to more jobs and opportunities.”*

6/29/17 Whitehouse.GOV

# Trump Admin Vision of American Energy Dominance

Trump Cabinet secretaries — Rick Perry -Energy, , Scott Pruitt – EPA, & Ryan Zinke - Interior:

- “Dominance” means being a “self-reliant and secure nation, free from the geopolitical turmoil of other nations that seek to use energy as an economic weapon.”
- “An energy-dominant America will export to markets around the world, increasing our global leadership and influence,”
- “For the first time in four decades, the energy story in the United States is about becoming an energy exporter and no longer about peak resources or being beholden to foreign powers,”
- “For years, Washington stood in the way of our energy dominance,” ..... “That changes now.”

*Washington Post 6/29/17*

Using the Trump Administration definition/understanding of Dominance, the US will dominate in energy sectors where we can achieve two objectives:

- (1) Meet all of our domestic demand/needs.
- (2) Export to markets around the world at a level where we can “influence the market” .

- In the 1980’s, and 1990’s ....OPEC dominated oil on a global basis.
  - Australia and Indonesia currently Dominate Coal
  - Australia & Qatar Dominates Natural Gas (LNG)
    - Where can America “Dominate”?

# Can the US Dominate Energy?

- US Energy Overview – Where do we get our energy, where does energy go?
- Review the Trump Administrations Energy Goals & Strategy – to date & what does it mean to “DOMINATE” energy?
- ➔ • SWOT Analysis – Strengths, Weaknesses, Opportunities & Threats Analysis - an Overview of America’s ability to “DOMINATE” energy.
- Answer the question, Can the US dominate Energy?
  - Look at each sector: Oil, Gas, Coal, Oil, Nuclear, Hydro/Geo, Bio-Fuels, Wind, Solar

# American Energy Dominance SWOT Review

## Strengths

- Strong resource positions in hydrocarbons, Coal, Gas, Oil.
- World Class Technology in resource extraction – Onshore & Offshore.
- Entrepreneurial society – responds relatively quickly to market forces able to quickly uptake new technology.
- Largest Energy consuming Economy in the world .
- Strongest existing energy distribution network in the world, energy transport, & energy refining.
- Access to the worlds financial resources & markets.
- Mature , generally effective regulatory environment.

## Weaknesses

- Existing & Prior Federal policy focused on higher cost less reliable energy production , while discouraging low cost reliable HC based energy production.
- Regulatory environment historically underestimates costs and over estimates benefits....especially relative to “renewable energy.
- Energy commodity markets are not primarily driven by market forces. Too much instability generated by computerized commodity trading ca ~80%

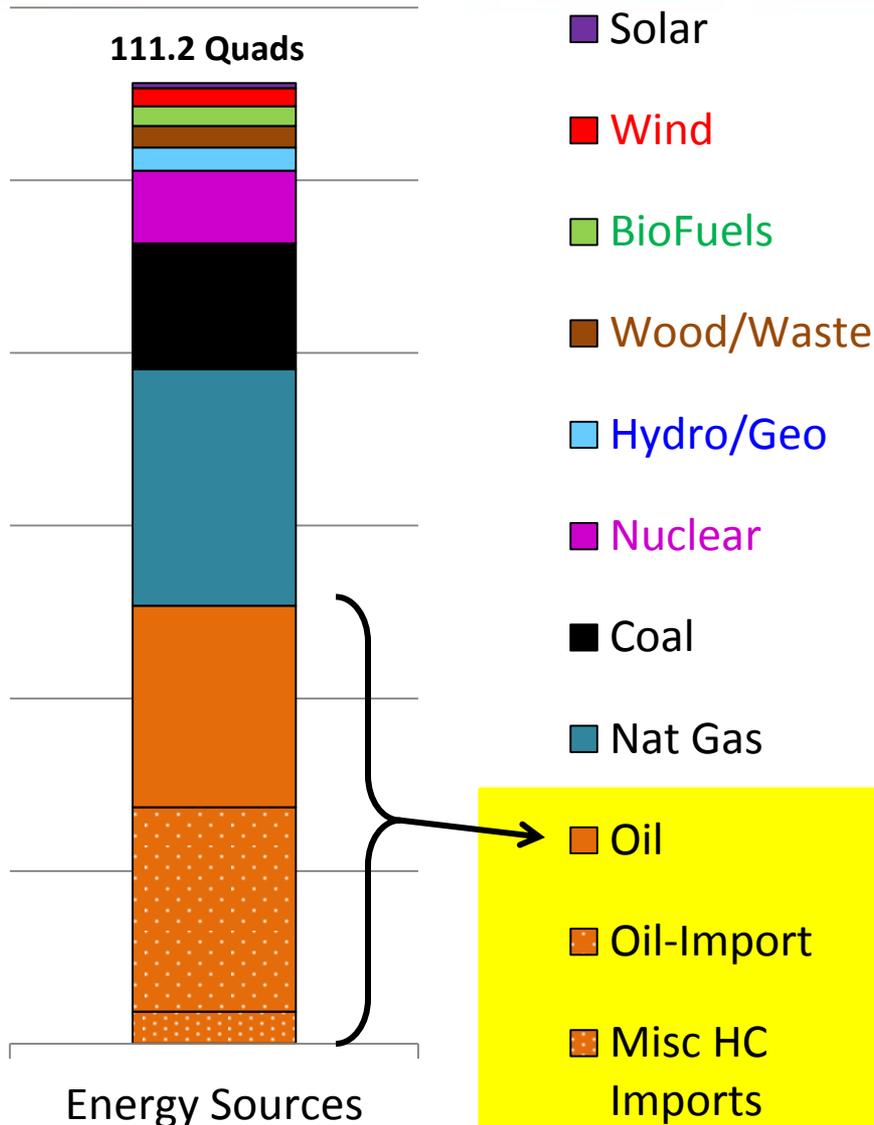

## Opportunities

- Efficiency gains – the worlds largest energy consuming economy also has the greatest potential to increase efficiency.....for the right reason.
- Fully understanding our energy resources...we do not live in a physical world of scarcity. Do we even “know what we don’t know?”
- How would our foreign policy and the cost of that policy change if we were fully energy independent? Upside far exceeds the downside.

## Threats

- US society is relatively technologically illiterate, ....and the trend is in the wrong direction....can the public understand and support an energy policy that considers all the +/- of each energy source.....esp nuclear & HC based energy?
- Regulatory Environment under increasing political influence....both ways.
- Cost trends may make US energy non-competitive. – we are not the low cost producer in oil, & nuclear.
- Coastal states have or are likely to enact policies discouraging export of American HC based energy.

# America's Energy Resources & Dominance

## Can America Dominate Oil?

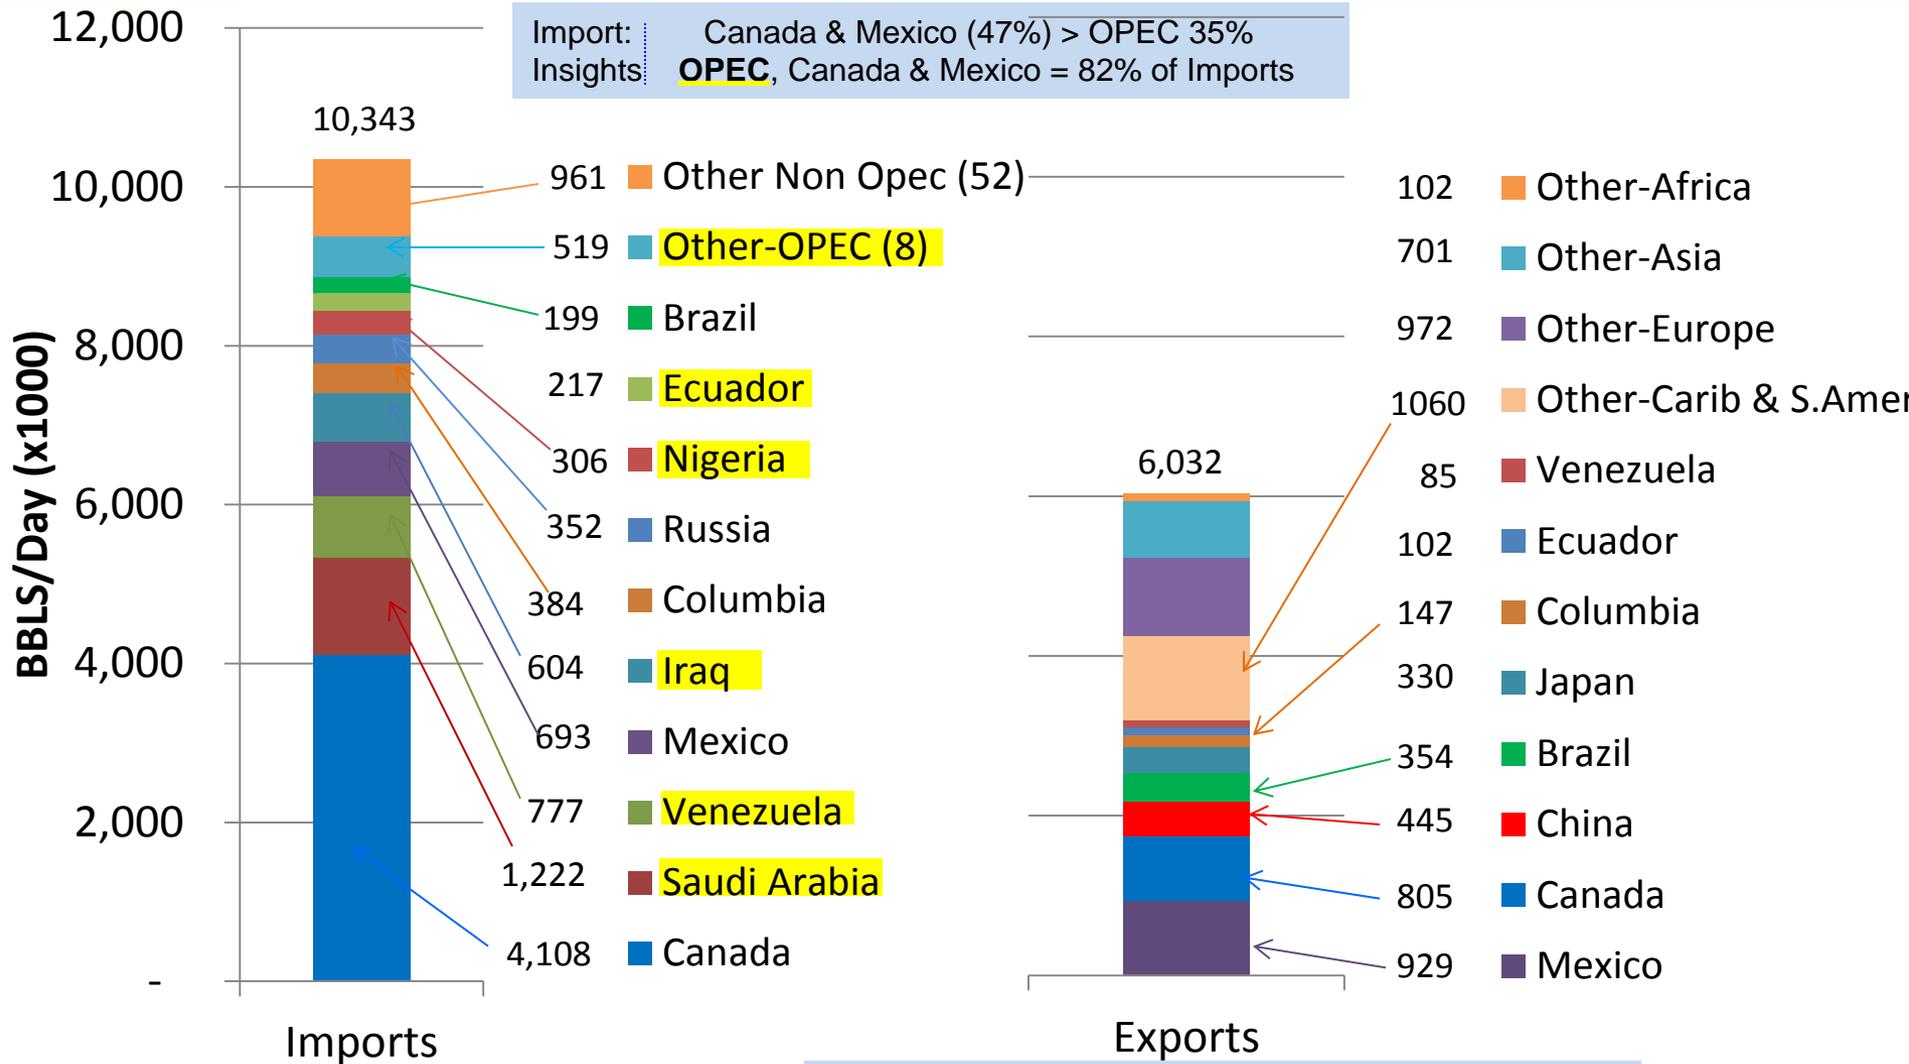

Do we meet our current domestic demand?

Do we have the reserves to dominate?

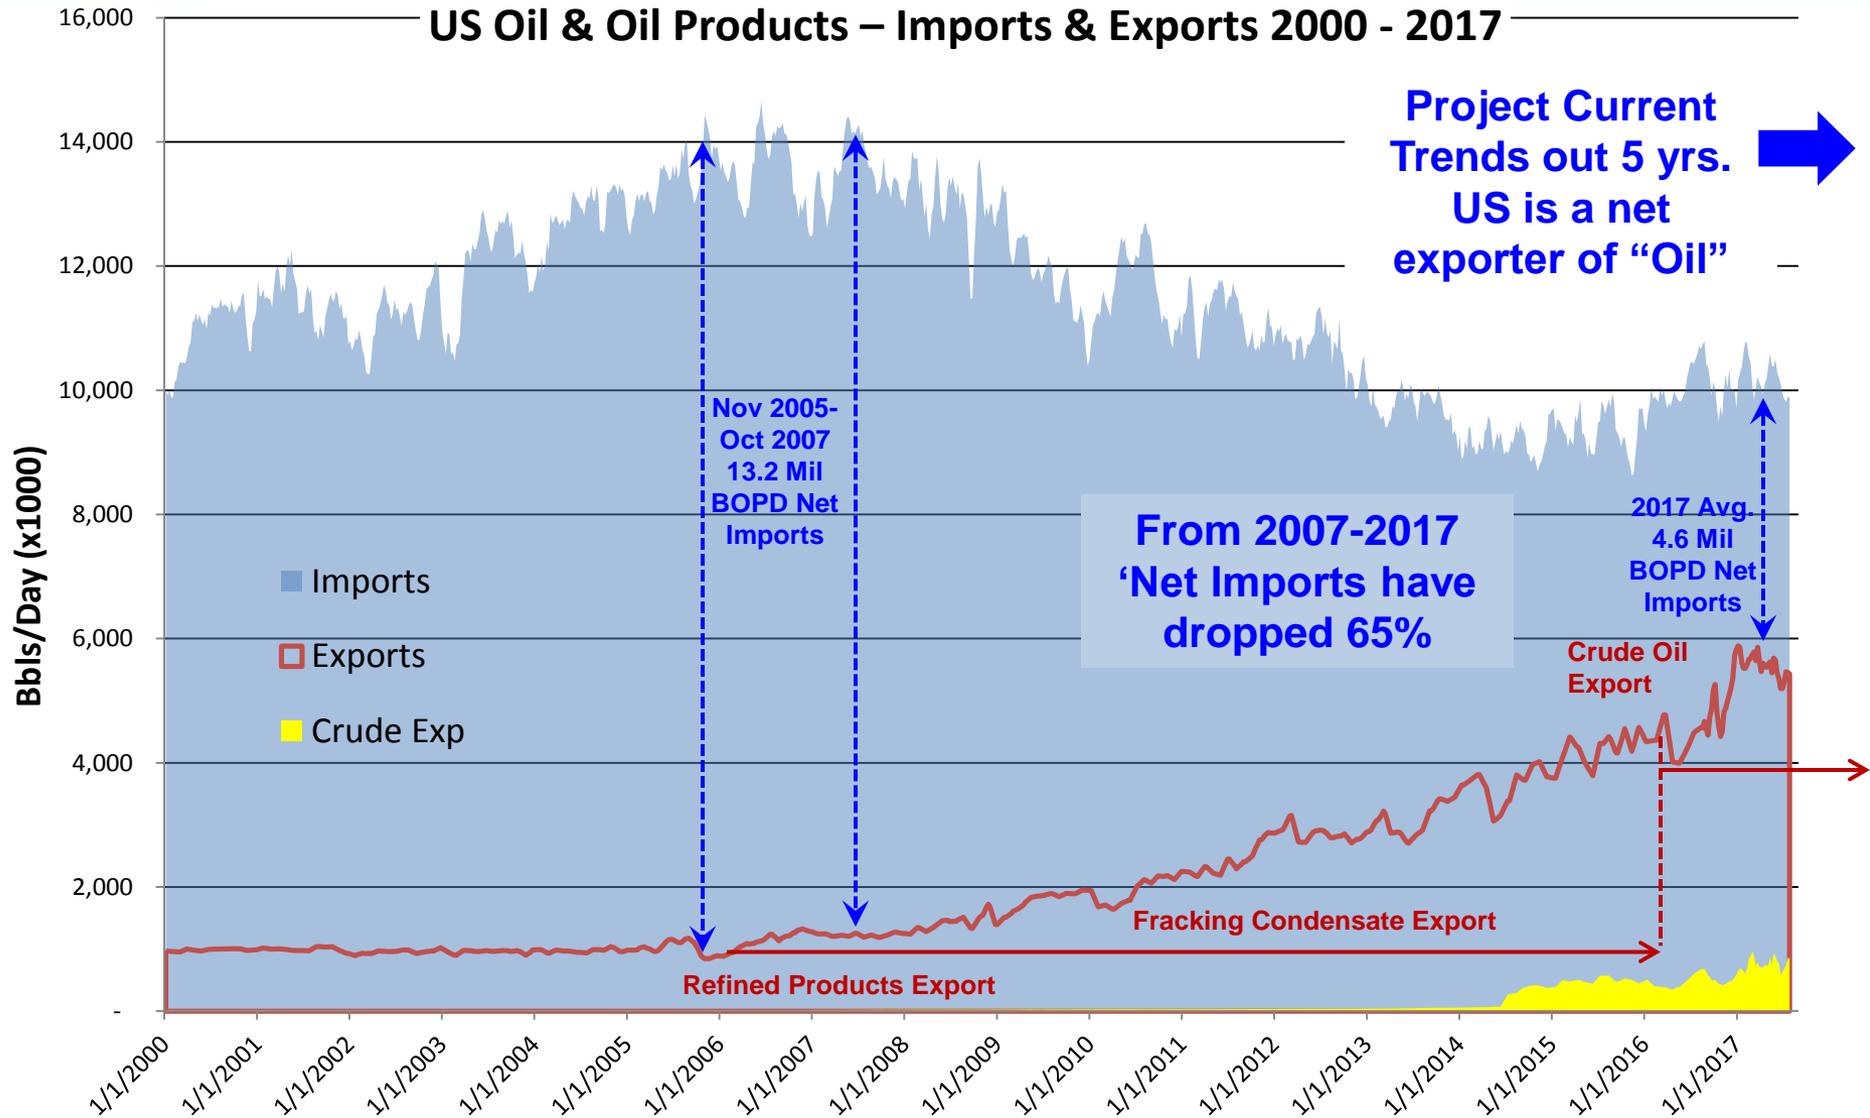

How much excess capacity do we have to generate exports?

Do we have the mechanisms and policies to enable exports?

# From whom do we Import "Oil" and who takes our Exports?

# Can the US Meet Domestic "Oil" Demand?

# Where are the World's Proven Oil Reserves

Reserves-to-production (R/P) ratios

Years

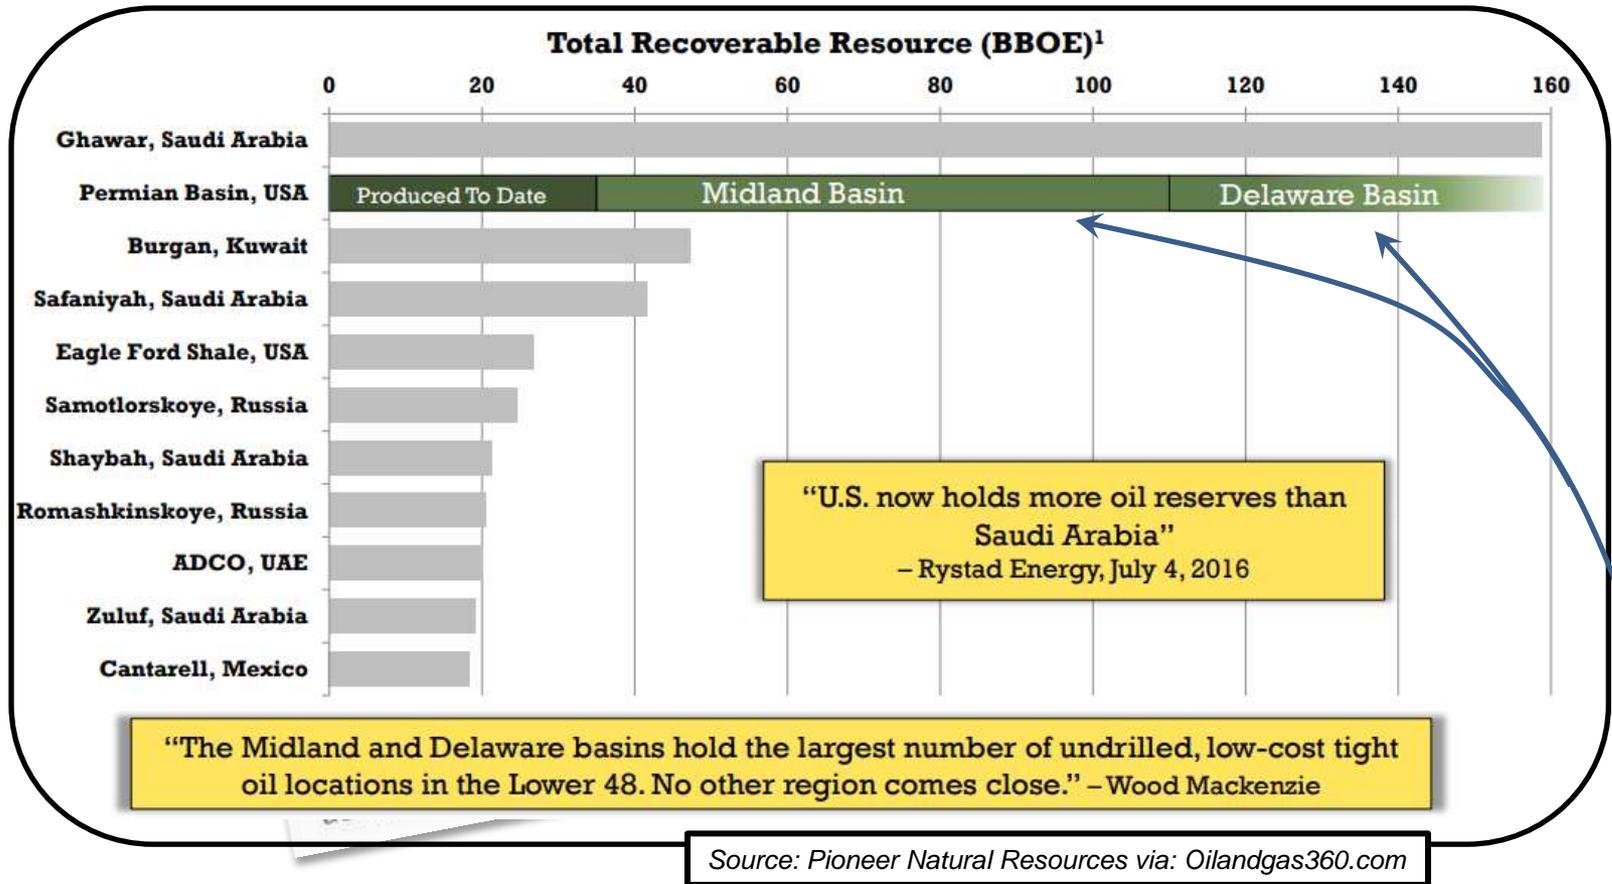

2016 by region

Vast majority of reserves need to be blended with light weight crudes, definitely an opportunity for the US to increase exports

Low R/P for a country that aspires to dominate Long term.

# Do the latest Global Oil & Gas reserves fully account for the “Fracking” revolution?

- Ans: No. What is the impact if the Pioneer Permian Basin reserve est is correct? The USA gains 135 Bln BOE in reserves.

# What if US “Permian Shale Oil” = Ghawar

## Reserves-to-production (R/P) ratios

Years

2016 by region

# The US Shale Oil and Gas Resource / Reserves Question

In terms of Oil resources the US is a lot like Venezuela – we have the resources.

But do we really have the reserves?

Resources  $\neq$  Reserves

Resource is what is physically there,

Reserves are the portion of the Resource that can be economically produced.

Resources are only the first step to dominance, in the end Reserves are what really matter.

Does the US only have “Big” reserves intermittently in high price environments?

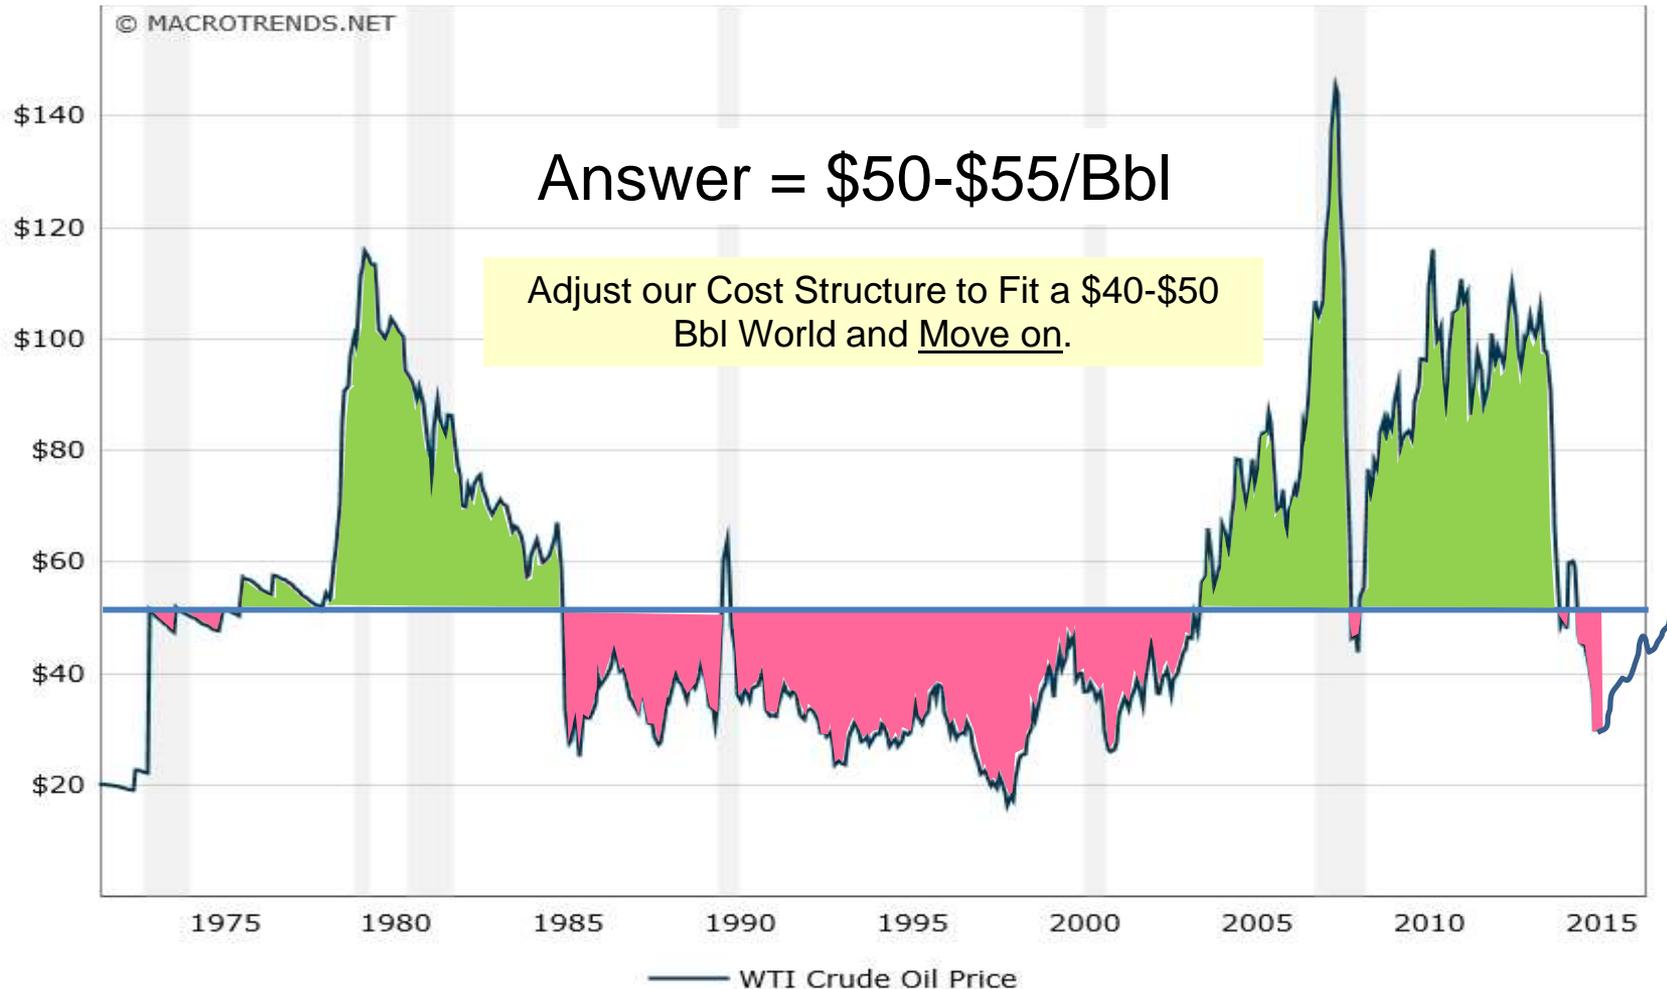

Or, can US Shale Oil compete at lower prices..... and how low, is low?

# 1<sup>st</sup> Question - What is the “Reserve Basis” Oil Price?

The “Average Joe” Oil Price  
Inflation Adjusted Average Oil Price over the last 40 yrs =?

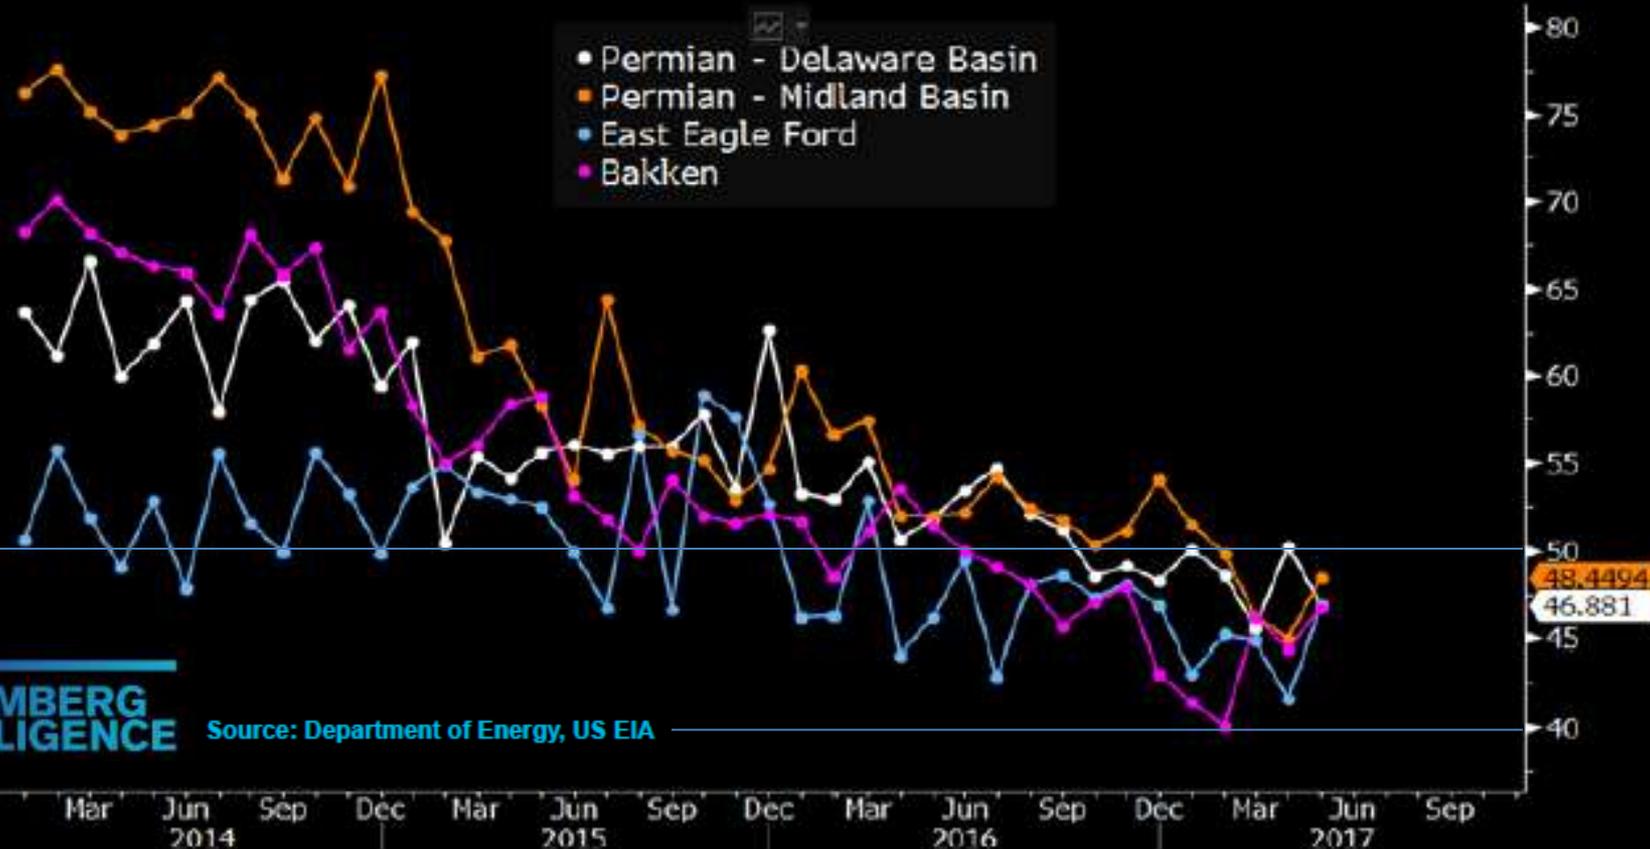

**Answer = \$50-\$55/Bbl**

Adjust our Cost Structure to Fit a \$40-\$50  
Bbl World and Move on.

# Can the US Oil Shale Play Complete @ \$40-\$50/Bbls

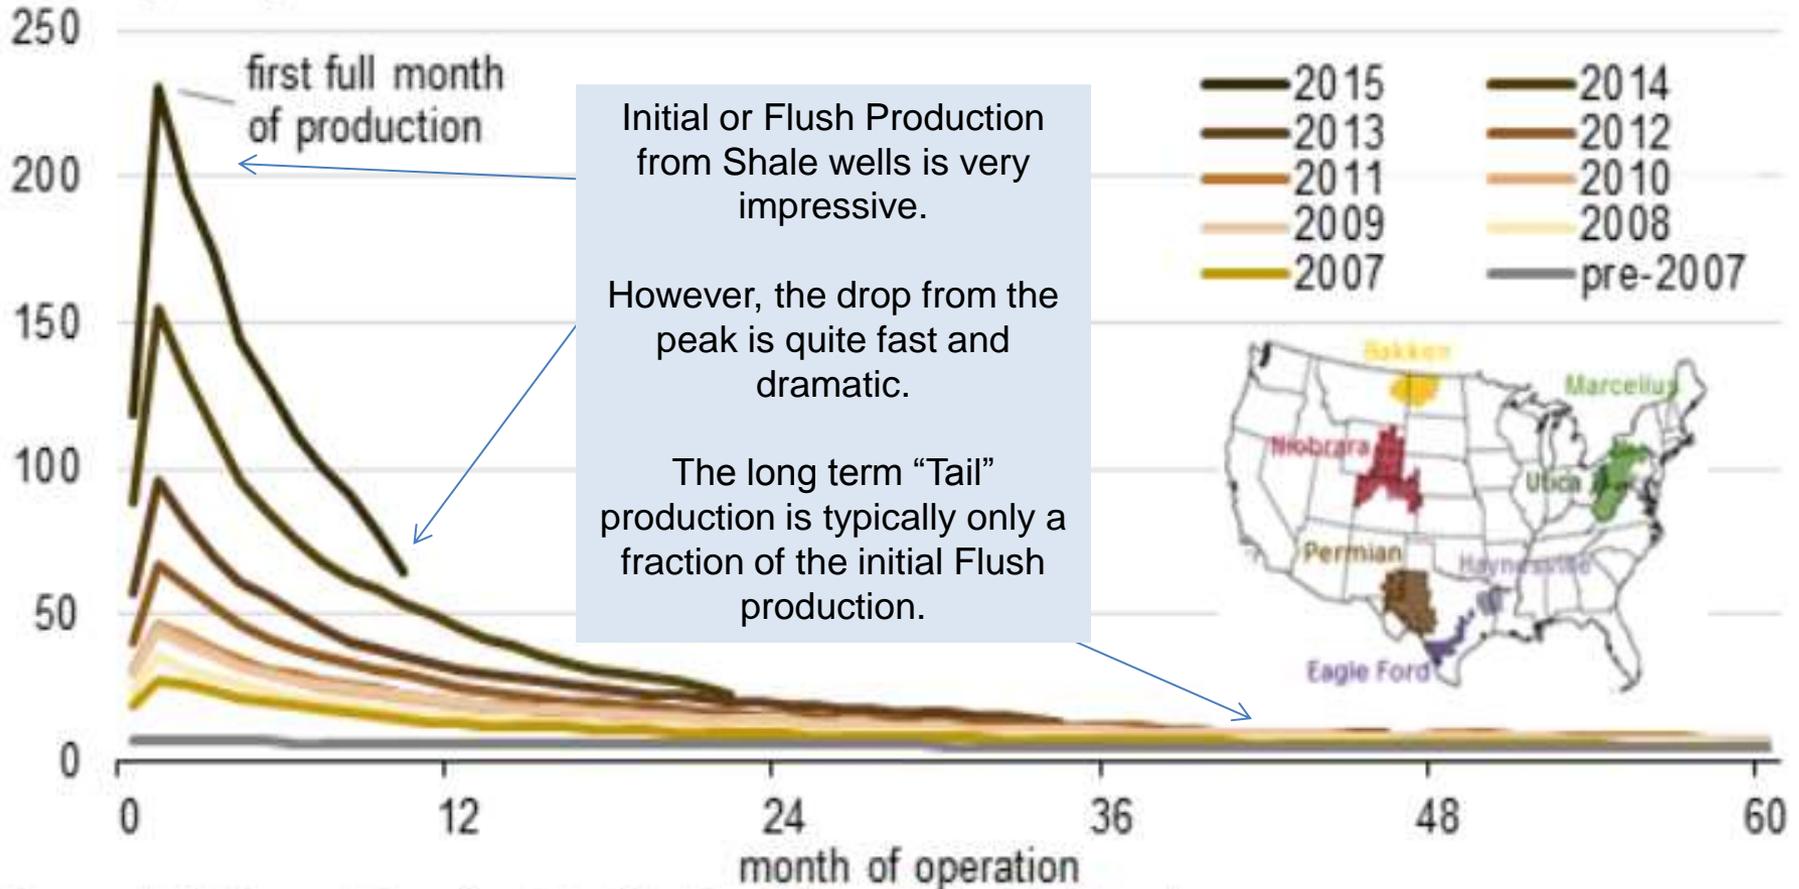

## U.S SHALE BREAK-EVEN PRICE BELOW \$50/BBL ACROSS BASINS

ANSWER - Yes, we can.

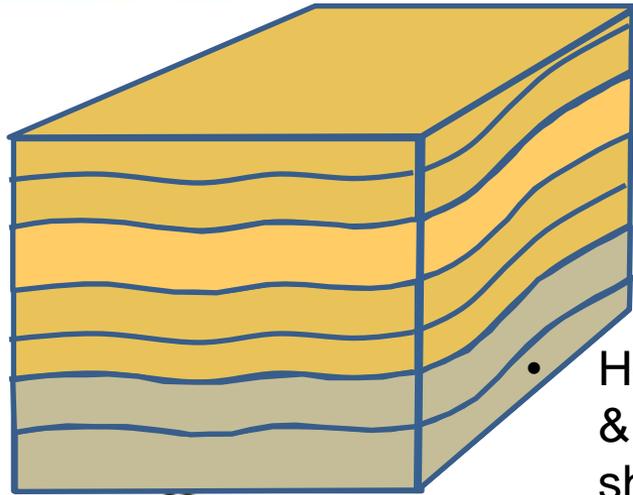

# Shale Oil – Production Trends The Flush & The Tail

Average oil production per well in the Permian region  
barrels per day

Source: U.S. Energy Information Administration, *Drilling Productivity Report*

# Fracking CW – Why The Flush Production – Then Decline?

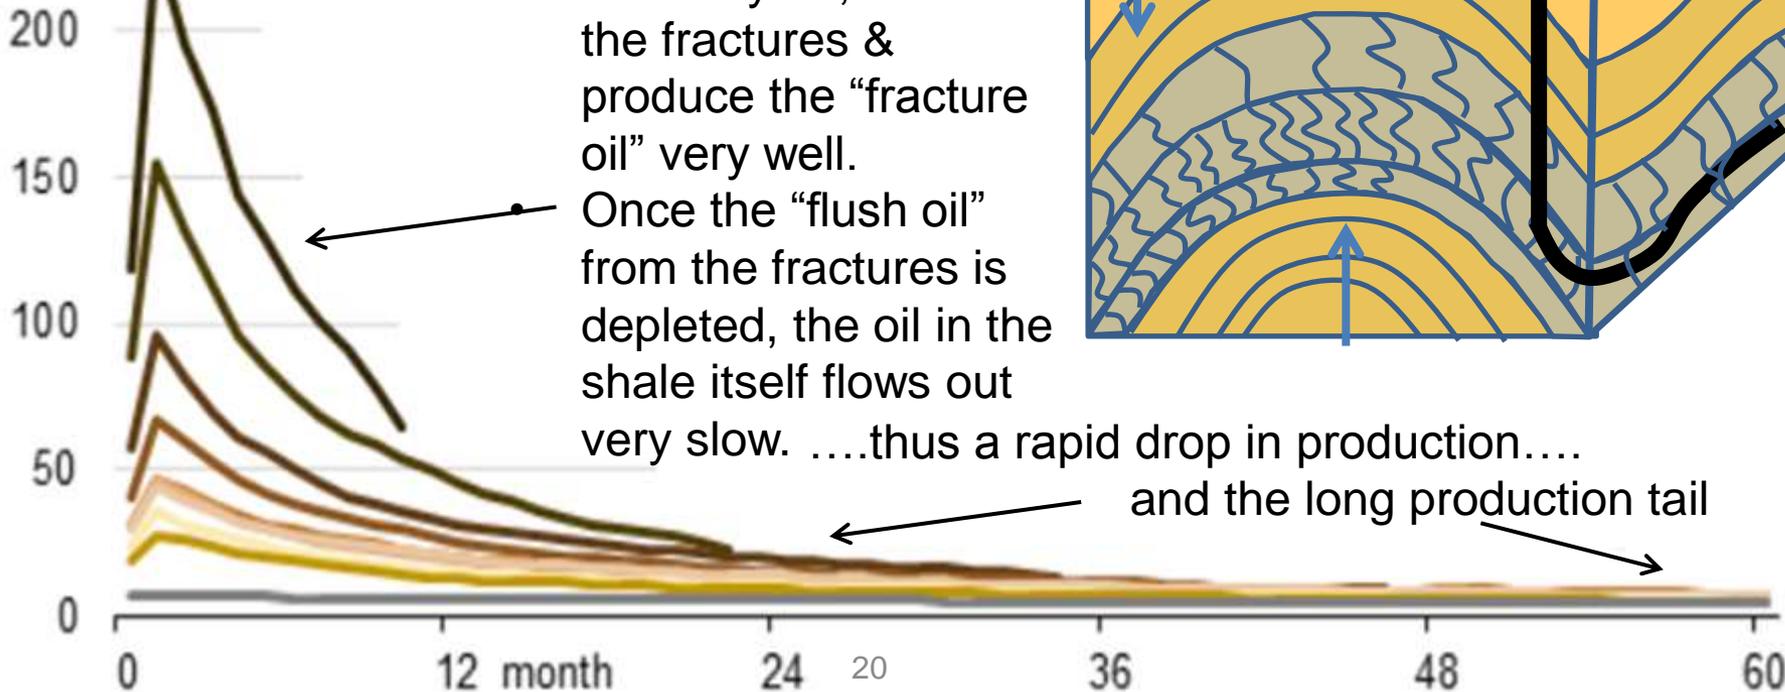

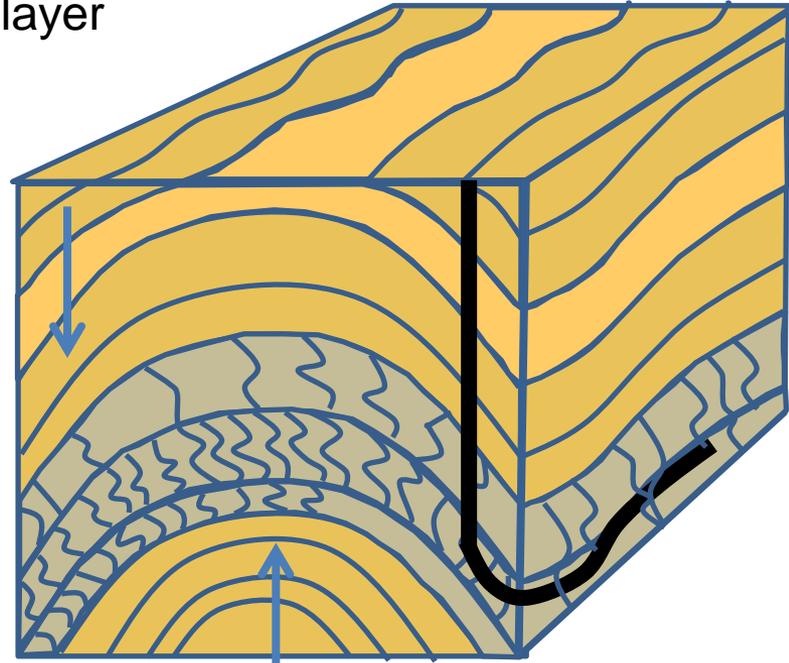

- In Oil Shale deposits the rock has a low permeability.
- Over millions of years the rock is stressed & cracks.
- Oil seeps into cracks, but the oil has not migrated out of the shale rock layer

• Horizontal wells drilled & fracked along the shale layers, connect the fractures & produce the “fracture oil” very well.

Once the “flush oil” from the fractures is depleted, the oil in the shale itself flows out very slow. ....thus a rapid drop in production....

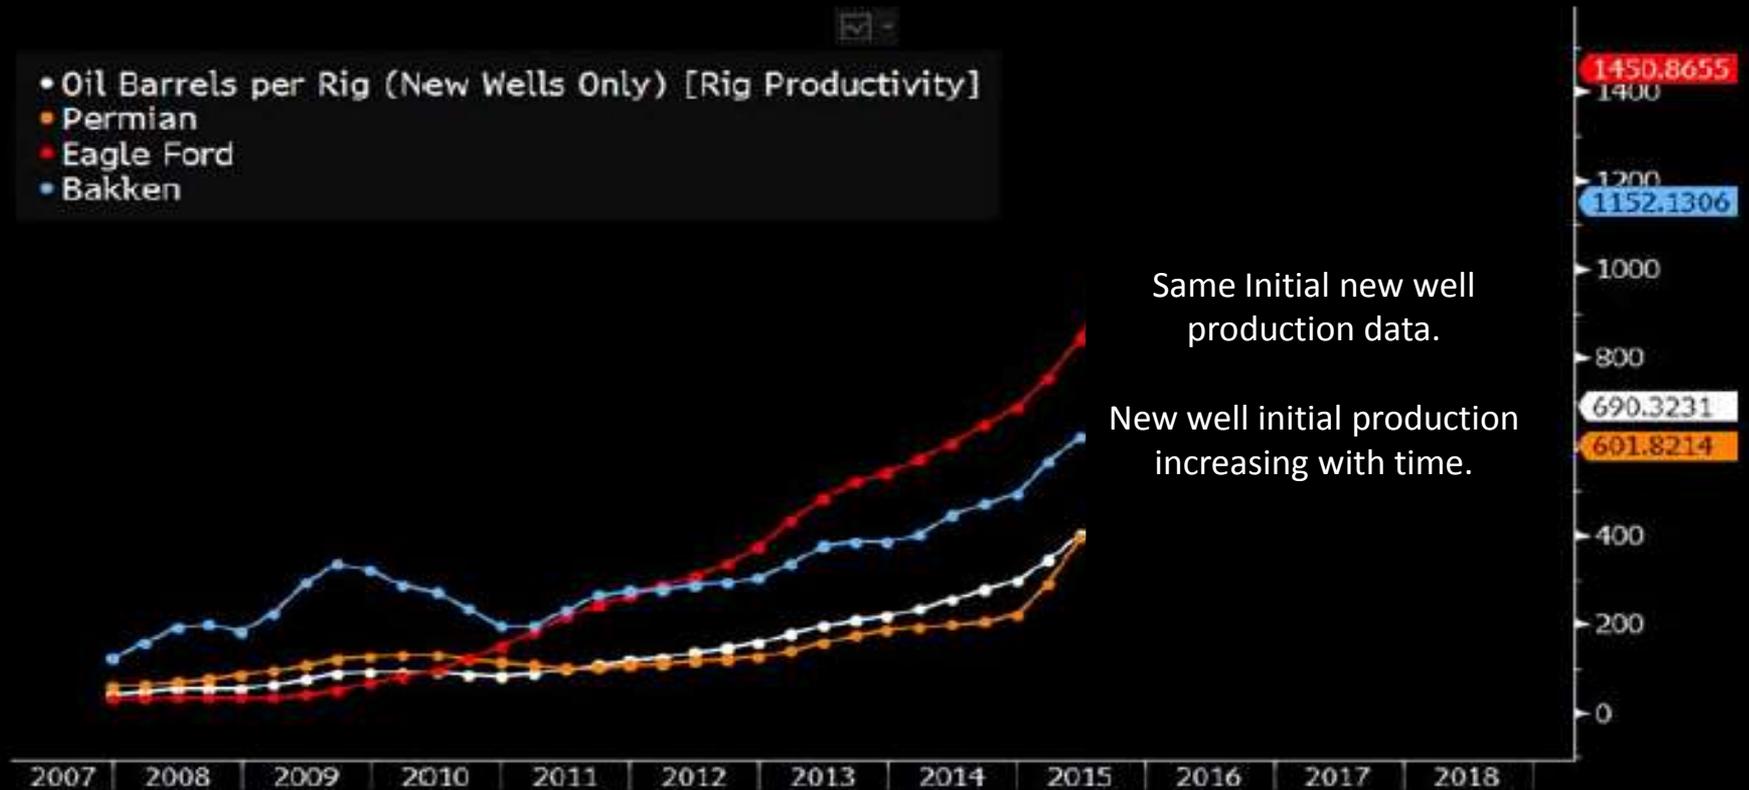

and the long production tail

# So what is the real return on an Oil Shale Well...is there a real and significant production tail?

## U.S. NEW-WELL OIL PRODUCTION PER RIG (BBL/D) KEEPS RISING

- Oil Barrels per Rig (New Wells Only) [Rig Productivity]
- Permian
- Eagle Ford
- Bakken

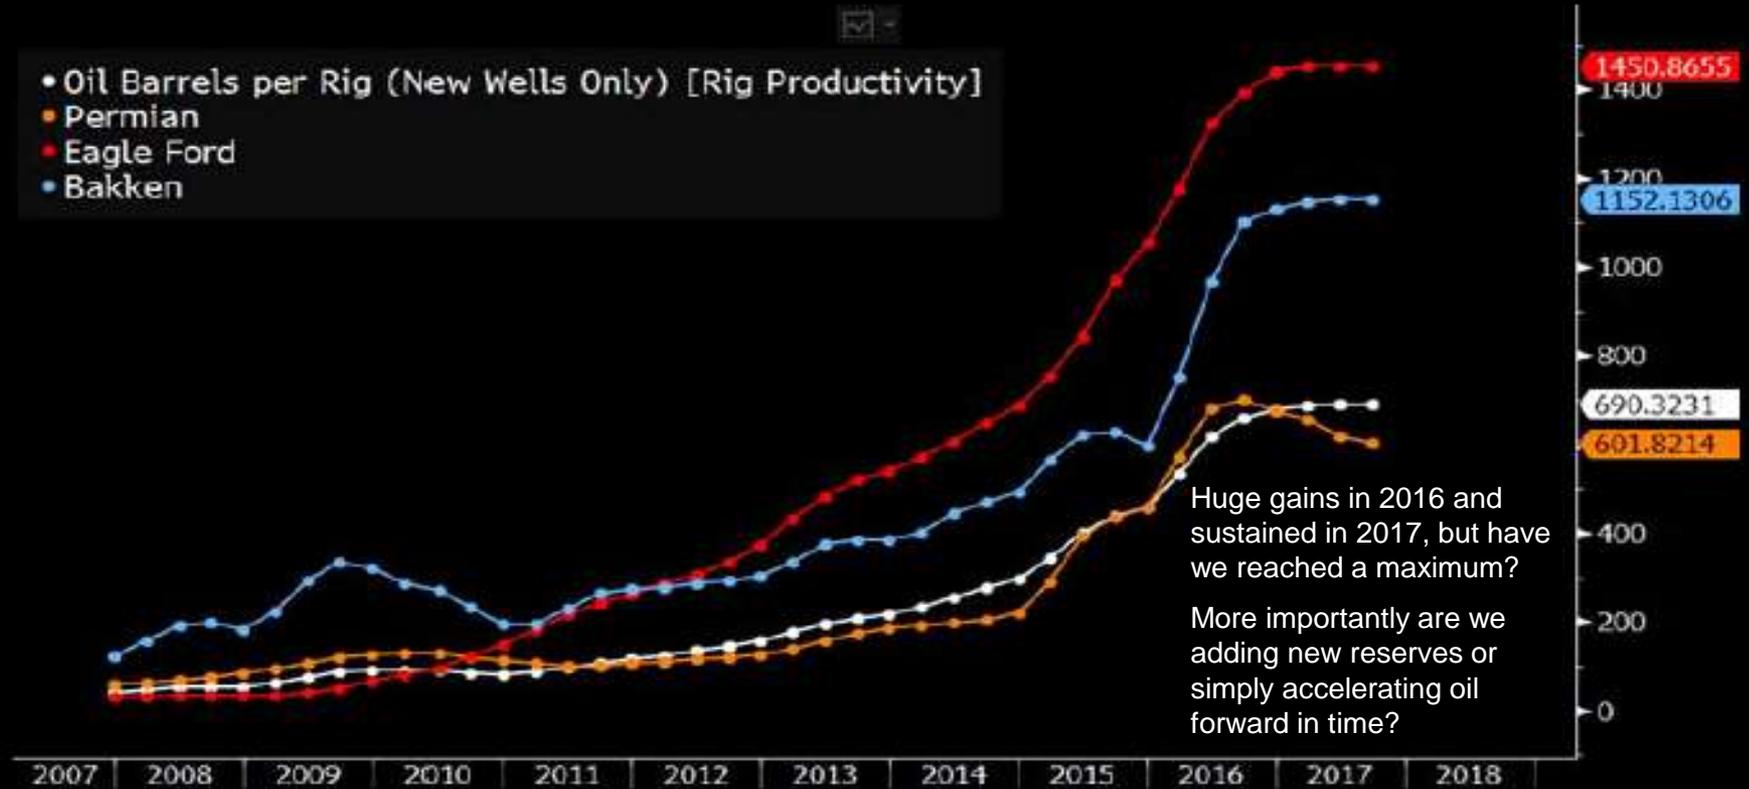

If these productivity gains can be sustained and represent additional oil reserves....then the US can and will DOMINATE Shale oil on a global basis.

Source: Department of Energy, US EIA

# So what is the real return on an Oil Shale Well...is there a real and significant production tail?

## U.S. NEW-WELL OIL PRODUCTION PER RIG (BBL/D) KEEPS RISING

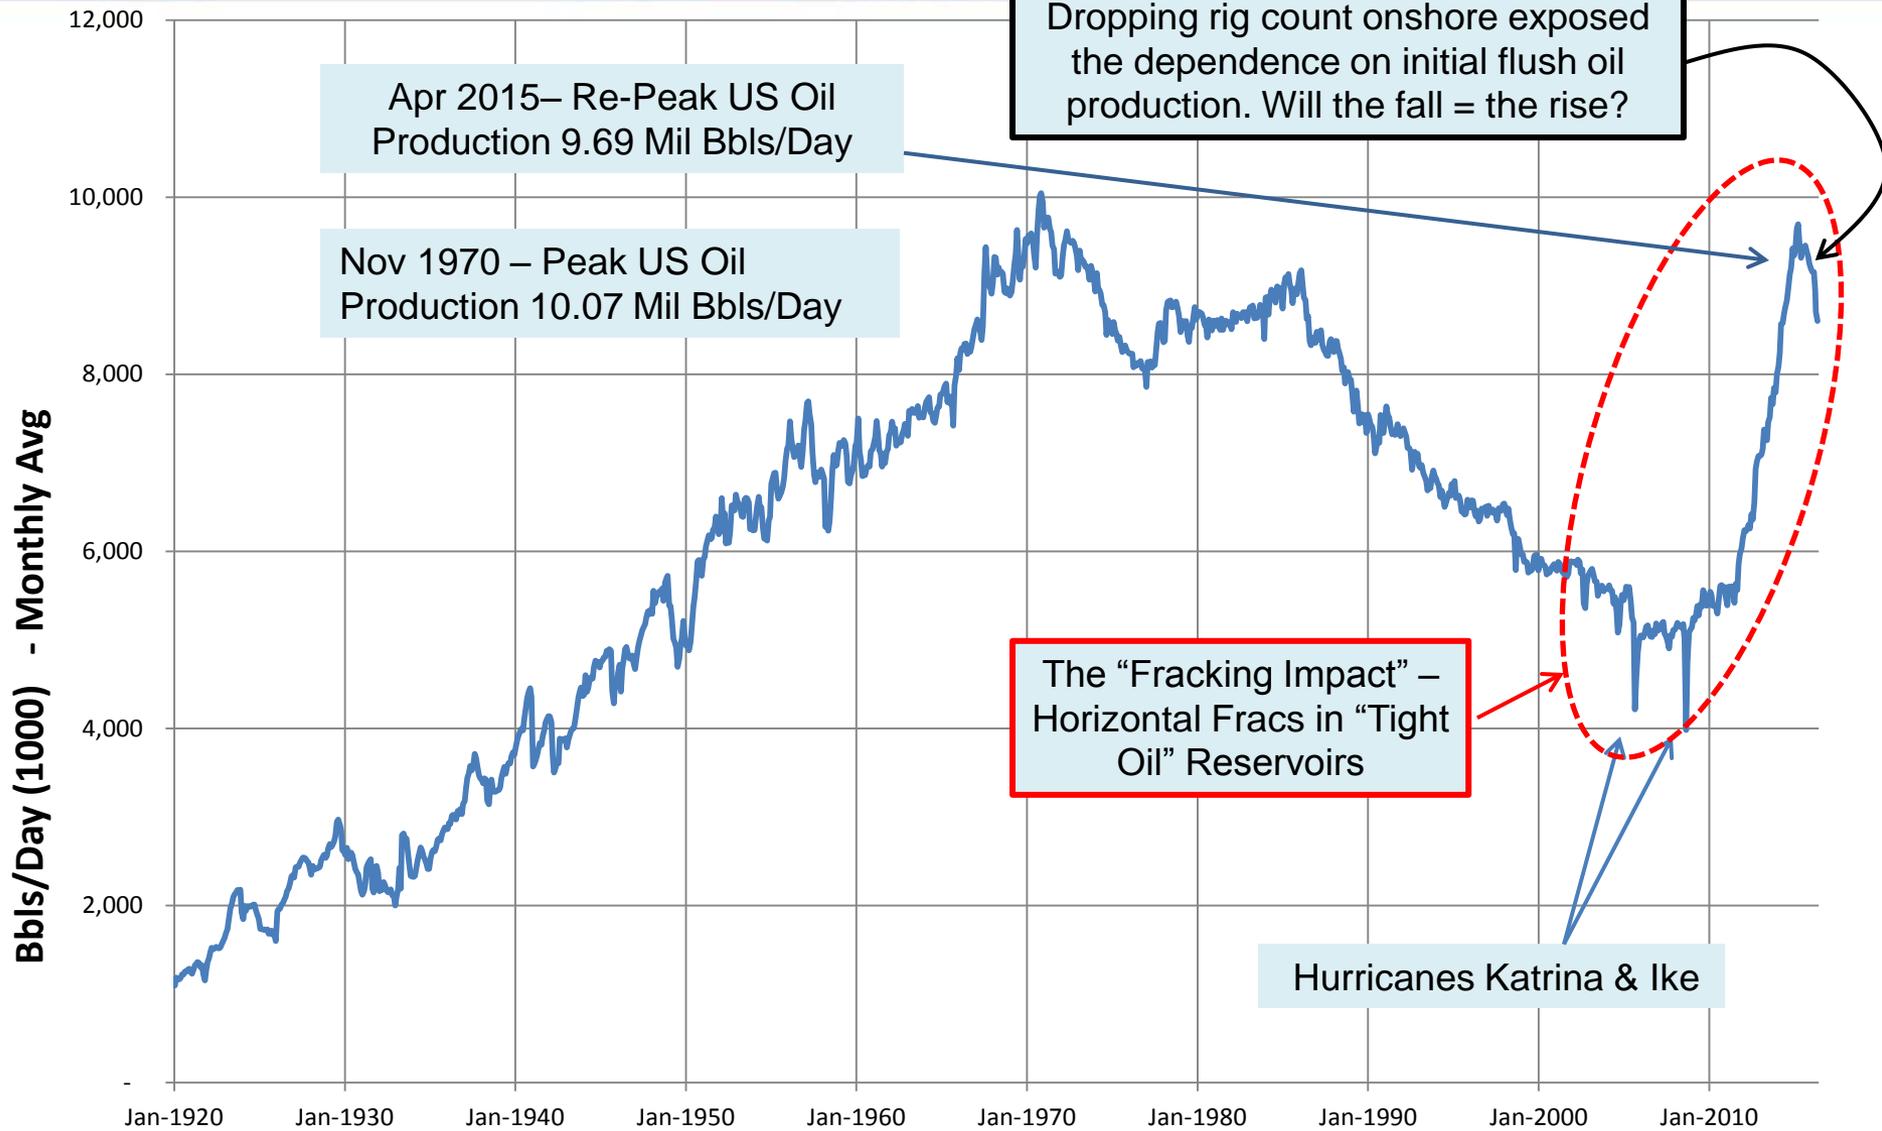

If these productivity gains can be sustained and represent additional oil reserves....then the US can and will DOMINATE Shale oil on a global basis.

Source: Department of Energy, US EIA

# US Oil Production Trends 1920 - 2017

Can the US Oil resurgence continue in \$40-\$50 oil?

# US Oil Production Trends 1920 - 2017

## U.S. CRUDE OIL PRODUCTION IS WITNESSING A RESURGENCE

# America's Energy Resources & Dominance

## Can America Dominate Oil?

Do we meet our current domestic demand?

Do we have the reserves to dominate?

How much excess capacity do we have to generate exports?

Do we have the mechanisms and policies to enable exports?

**YES**

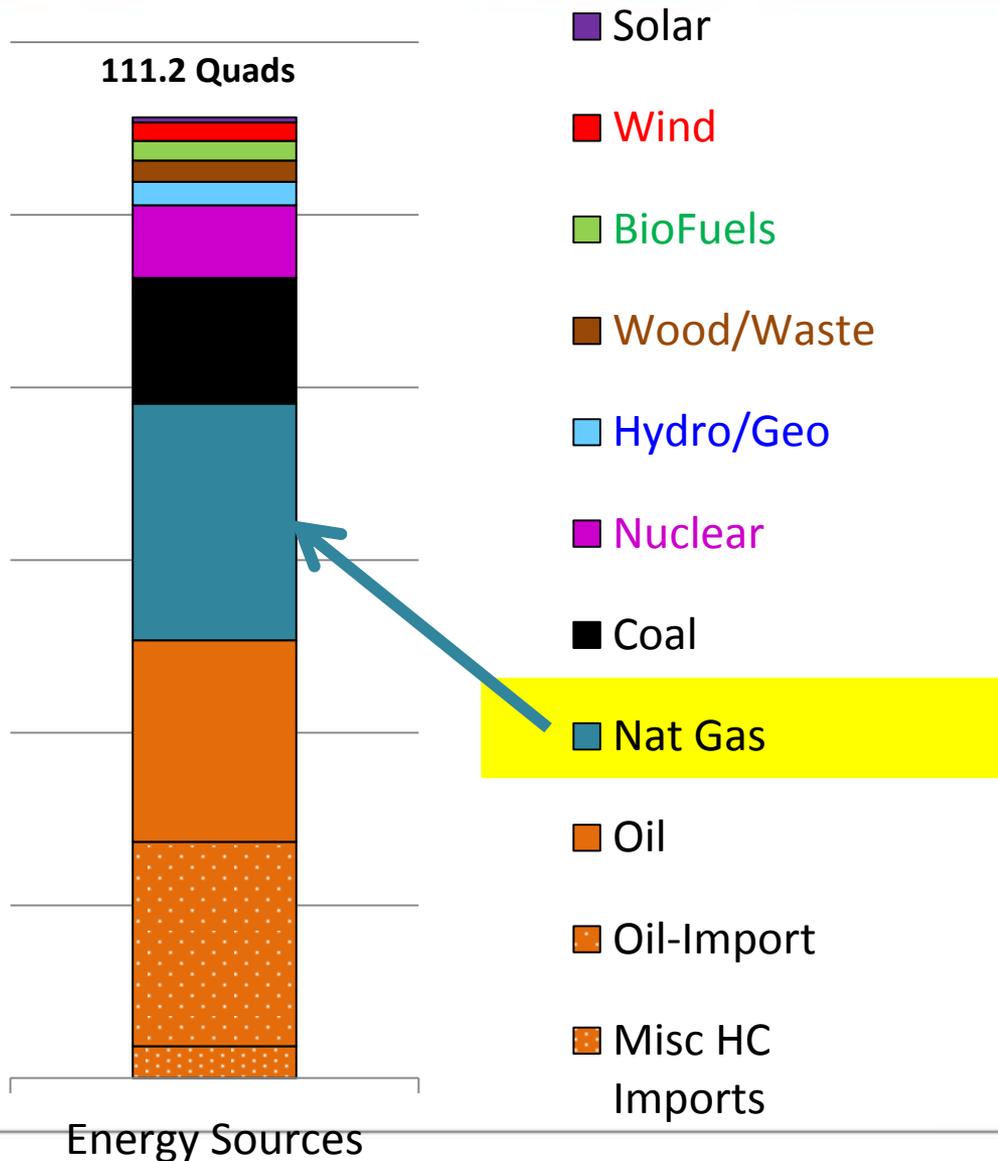

Not yet, but we are on course to be a net exporter in ~5 yrs

Yes if we can sustain our record offshore production and grow on shore oil @ \$40-\$50 /bbl oil.

Under some scenarios equal to any nation.

Yes, Obama Admin removal of the crude oil export ban is a big enabler of American exports.

# America's Natural Gas Resource & Dominance

## Can America Dominate Natural Gas?

Do we meet our current domestic demand?

Do we have the reserves to dominate?

How much excess capacity do we have to generate exports?

Do we have the mechanisms and policies to enable exports?

# Global Production & Consumption of Natural Gas

- The US is the global leader in Natural Gas production and consumption – meeting all domestic demand.
- ~2005-2009 the US moved from preparing Gulf Coast ports to **import** LNG to **export** LNG

## GLOBAL NATURAL GAS PRODUCTION

Country	BCM /Yr- Nat Gas Prod				Yr-Yr Growth	10 Yr Growth	%
	2013	2014	2015	2016			
USA	685	733	766	749	-2.5%	4.1%	21.1%

Total World	4,934	6,522	7,353	7,588	100%	52.5

The US and Canada due to a high Natural gas consumption rate have the lowest Reserves: Production ratio of major producing regions

- US Reserves have increased close to 100% from 2013 to 2015.
- No reserve increase in 2016.
- Factors driving low to no reserve additions:
  1. Low Nat gas prices and a historic low gas-rig count.
  2. The oil/gas price spread favors oil
  3. Increased productivity of the tight oil fracs, especially in the Permian basin.

On the global stage the US plays a minor role in LNG exports.

Exports would have to increase 20 fold for the US to “dominate” the global LNG markets.

To compete the US will have to increase reserves at the lowest cost, to offset the relatively high US LNG transport and handling cost.

# Natural Gas – LNG Process Cost Overview

Cost Component	Low	High
Liquefaction/Storage	\$1.50	\$2.00
Transport	\$0.50	\$1.20
Unload & Storage	\$0.30	\$0.40
<b>Total LNG Cycle Cost</b>	<b>\$2.30</b>	<b>\$3.60</b>

# America's Natural Gas Resource & Dominance

## Can America Dominate Natural Gas?

Do we meet our current domestic demand?

Yes and Exports are increasing significantly

Do we have the reserves to dominate?

Possibly not, but the uncertainty is huge.

How much excess capacity do we have to generate exports?

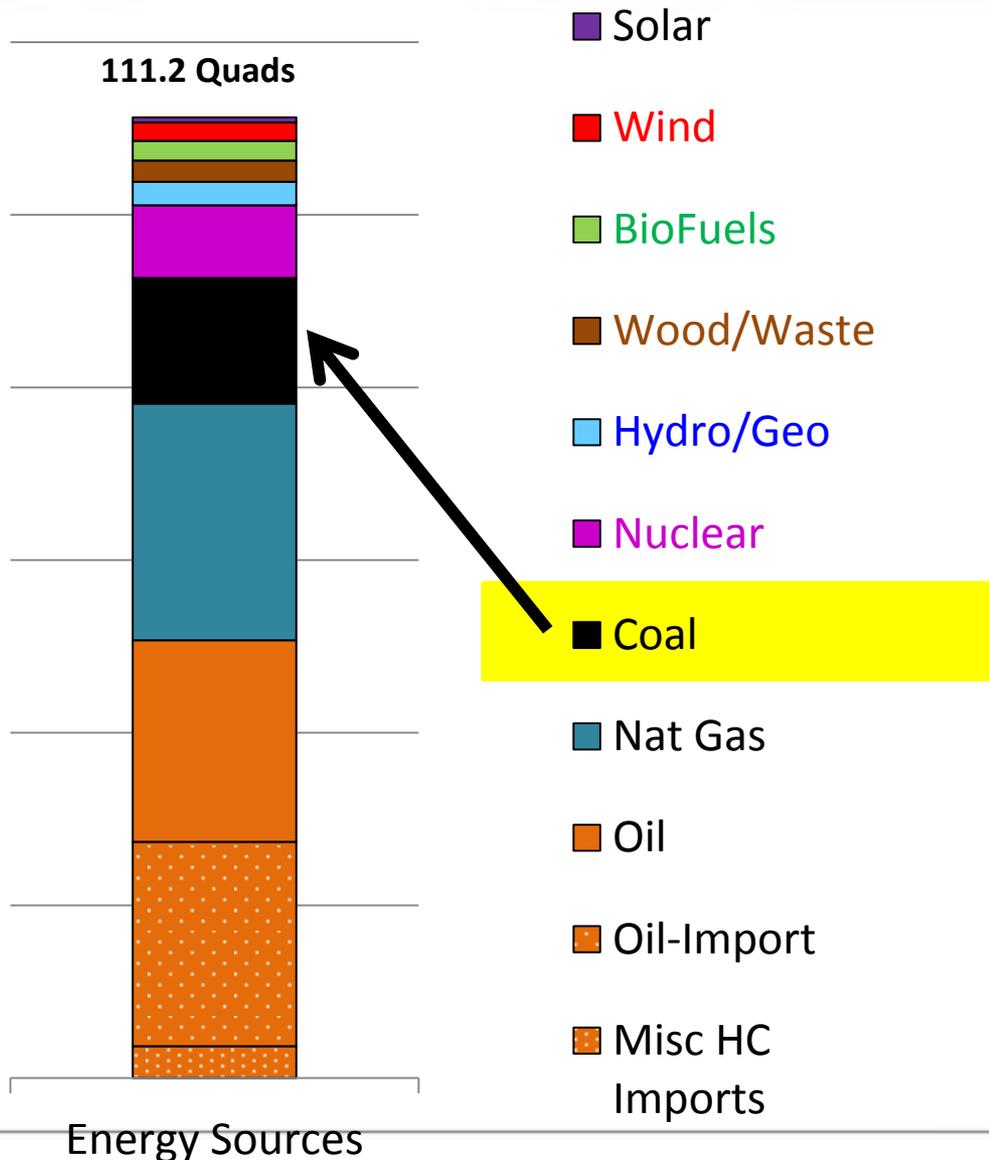

Short Term 5-7 yrs - Yes  
Long Term ?????

Do we have the mechanisms and policies to enable exports?

Yes, and if we project forward typical US Upstream Industry Optimization and Efficiency  
The US could be a global player.

Yes, but there are challenges.

# America's Energy Resources & Dominance

## Can America Dominate Coal?

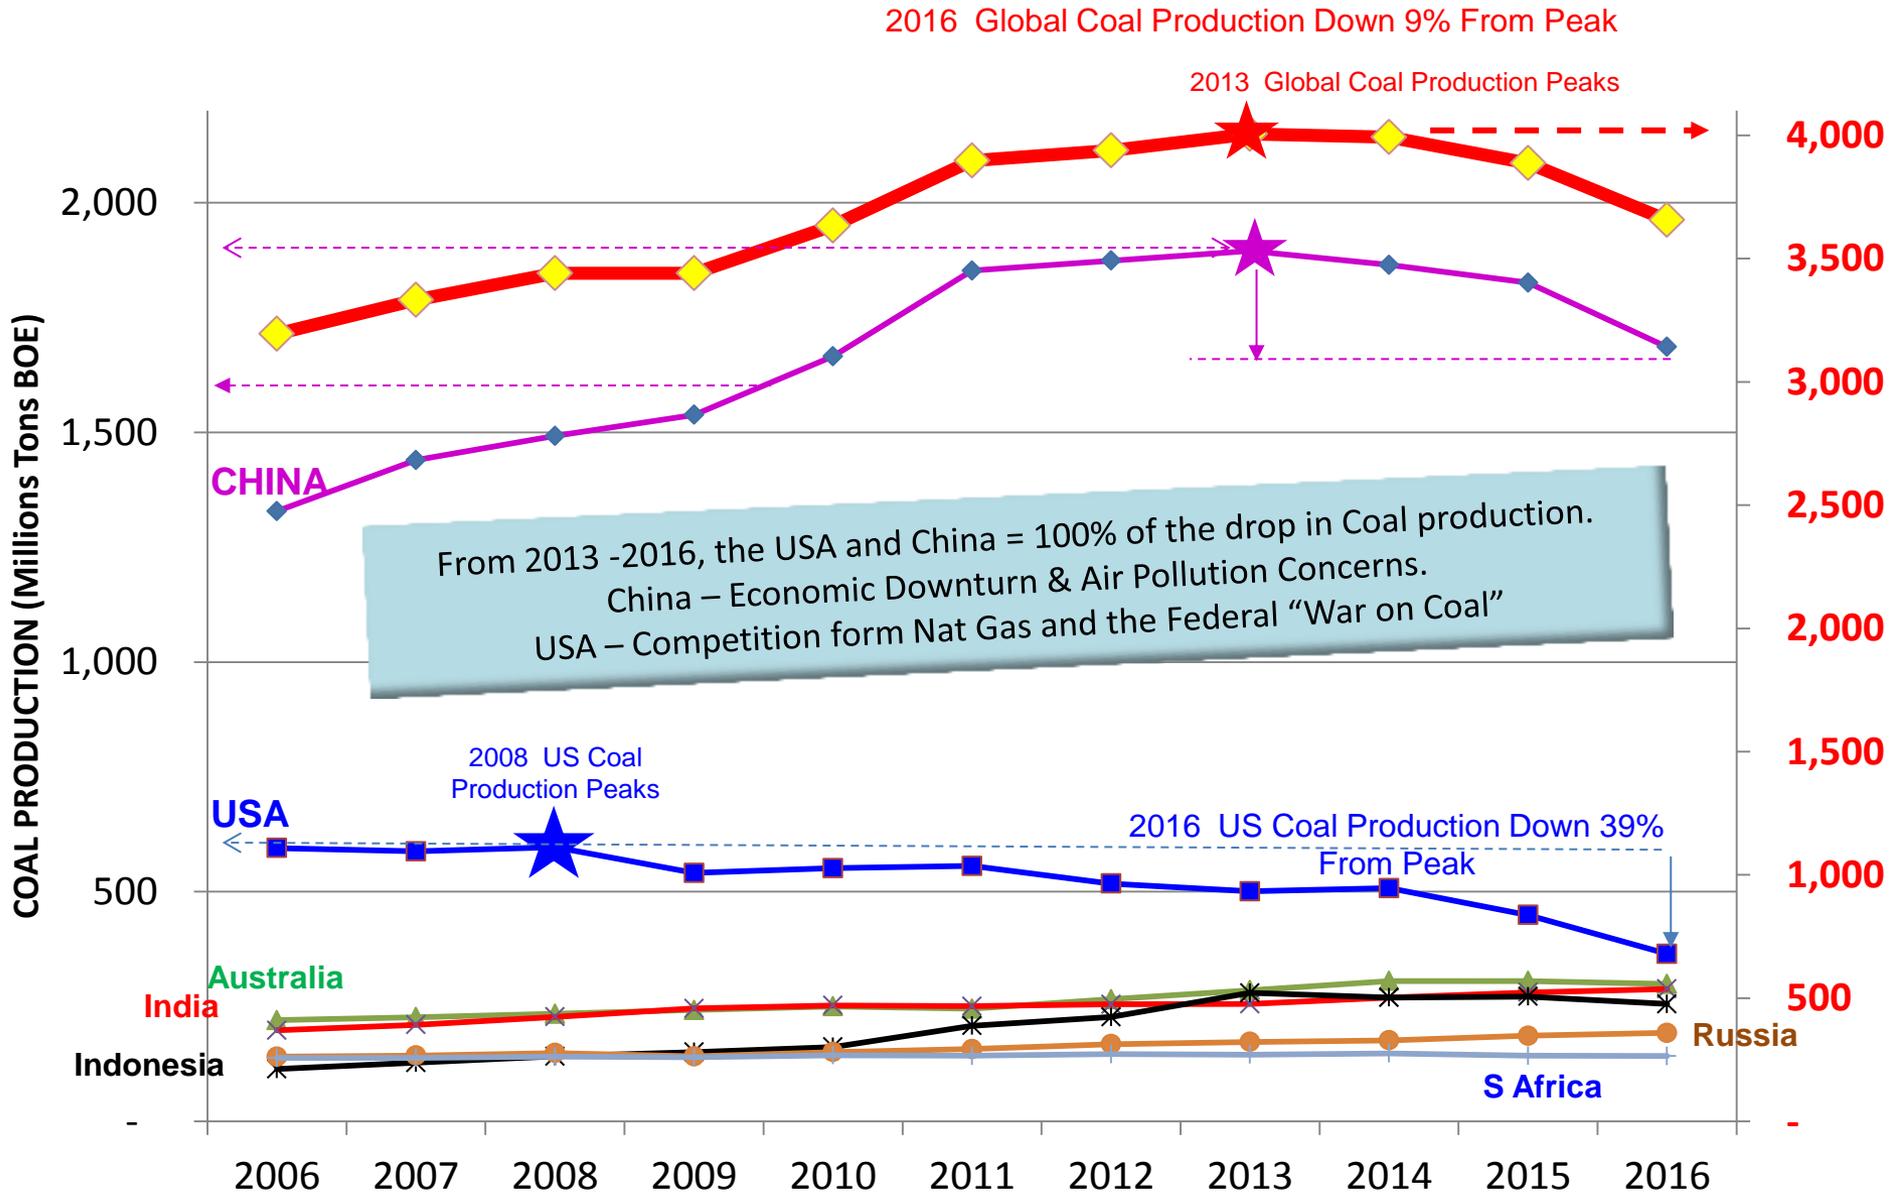

Do we meet our current domestic demand?

Do we have the reserves to dominate?

How much excess capacity do we have to generate exports?

Do we have the mechanisms and policies to enable exports?

# Coal Production Trends - Top 7 Global Producers

# Can the USA “Dominate Coal”?

- Domestically? Yes the US supplies 100% of US demand and even exports some coal.
- Internationally? Yes.....if.....and it is a big **if**.

- The US can compete in the export coal market.

- The reserves are there.
- US has the largest coal reserves in the world, capable of meeting US demand for 381 yrs.
- China is a close #2 in reserves , but China only supplies 88% of their internal demand and is an importer of coal.

Global Coal - Proved Reserves					
Country	Anthracite & Bituminous	Sub-Bit & Lignite	Total Coal (Mil Tons)	Global %	R/P
<b>United States</b>	<b>221,400</b>	<b>30,182</b>	<b>251,582</b>	<b>22.1%</b>	<b>381</b>

\* Million Tons of BOE/Yr

# US Nuclear Fuel Sources, Production and Capacity/Reserves

US Uranium Sources (2016 – EIA)

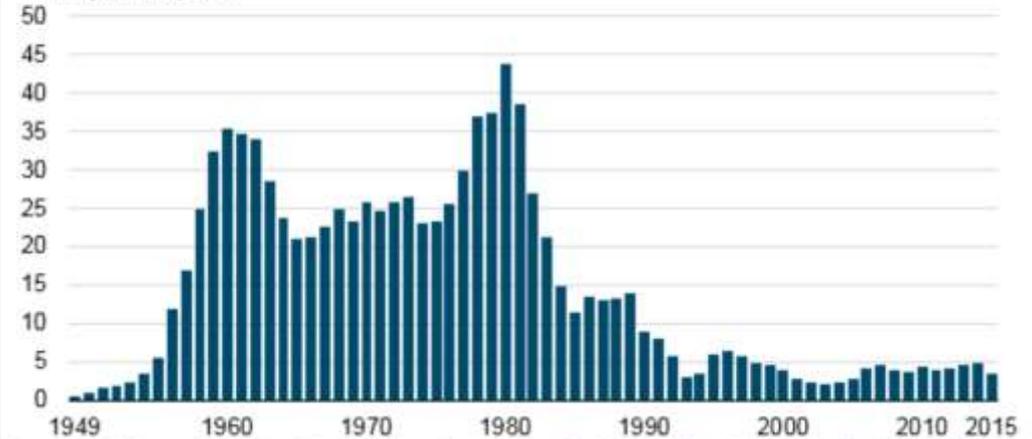

The US imports 89% of the Uranium used in Domestic Nuclear Fuel

Our Domestic Production is the same as 1940- Early 1950s

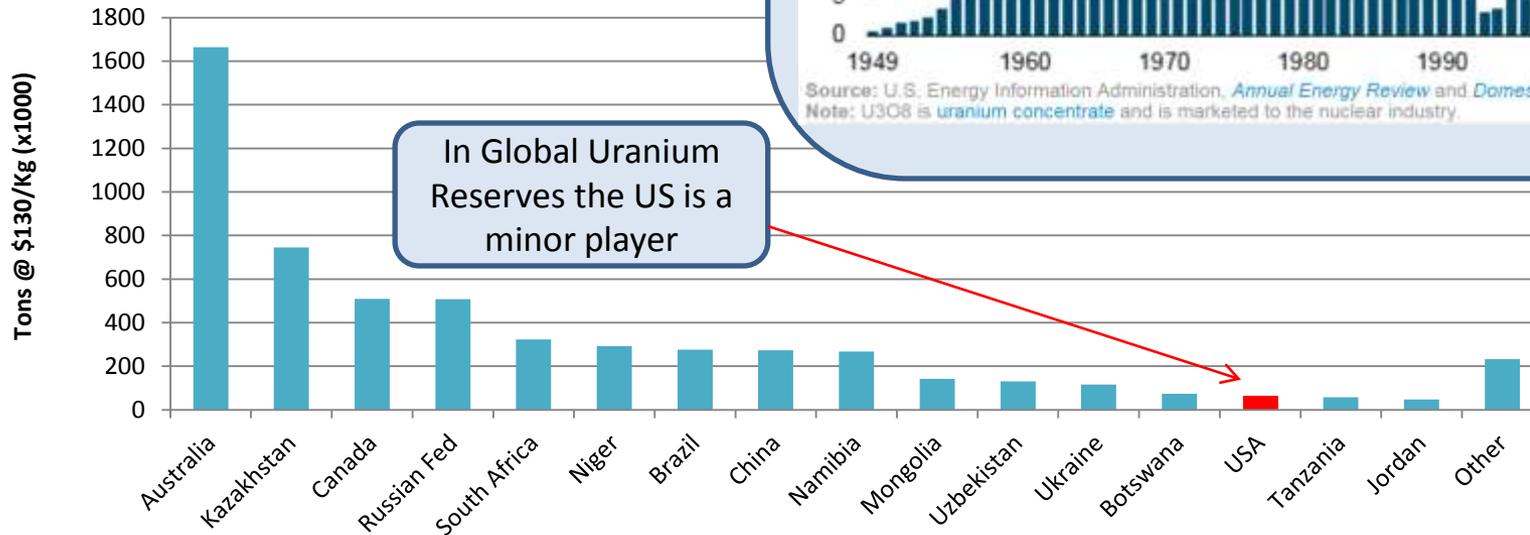

U.S. uranium production is near historic low as imports continue to fuel U.S. reactors

U.S. uranium concentrate production (1949-2015)  
million pounds U3O8

Source: U.S. Energy Information Administration, *Annual Energy Review* and *Domestic Uranium Production Report*  
Note: U3O8 is uranium concentrate and is marketed to the nuclear industry.

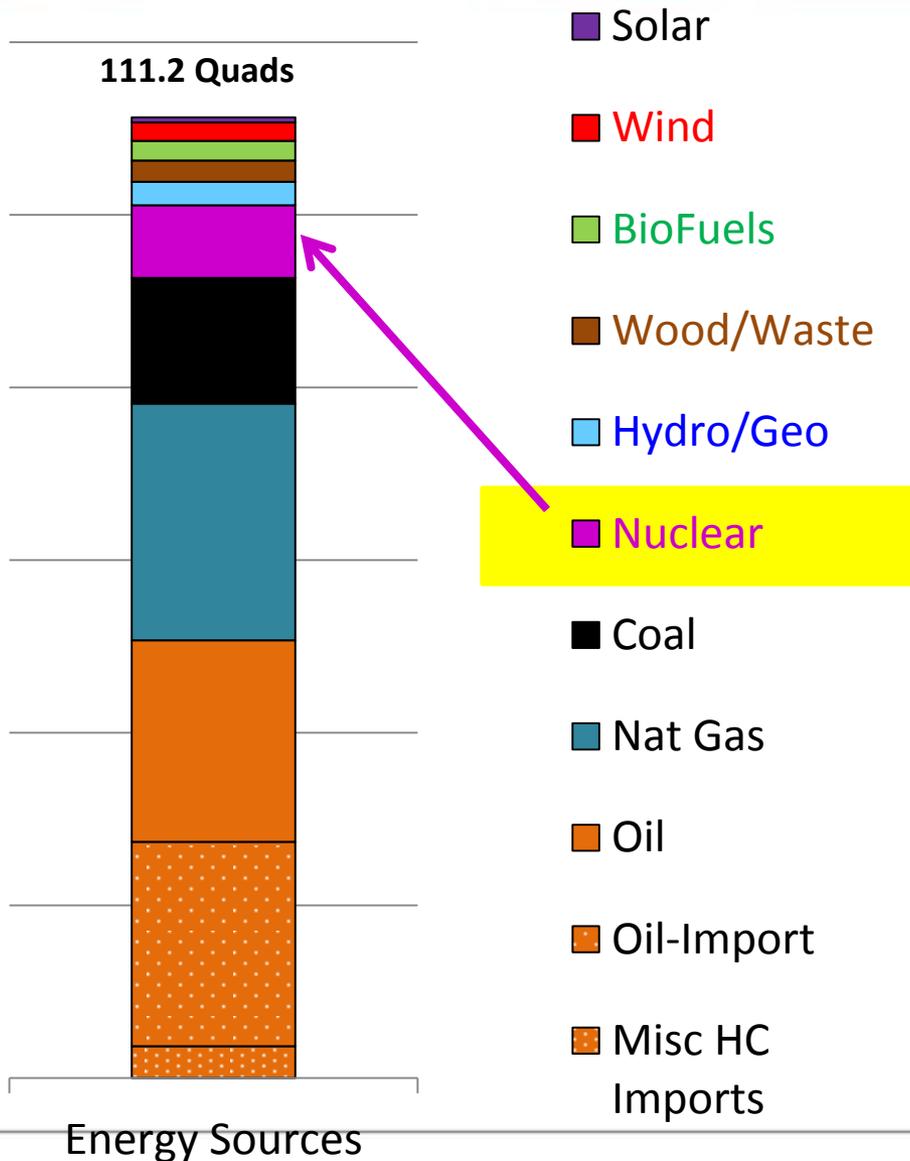

JUNE 1, 2016

In Global Uranium Reserves the US is a minor player

Raw Data Source:  
US EIA Annual Energy Review 2016

# America's Energy Resources & Dominance

## Can America Dominate Nuclear Energy?

No

Do we meet our current domestic demand?

NO, in terms of the fuel resource.

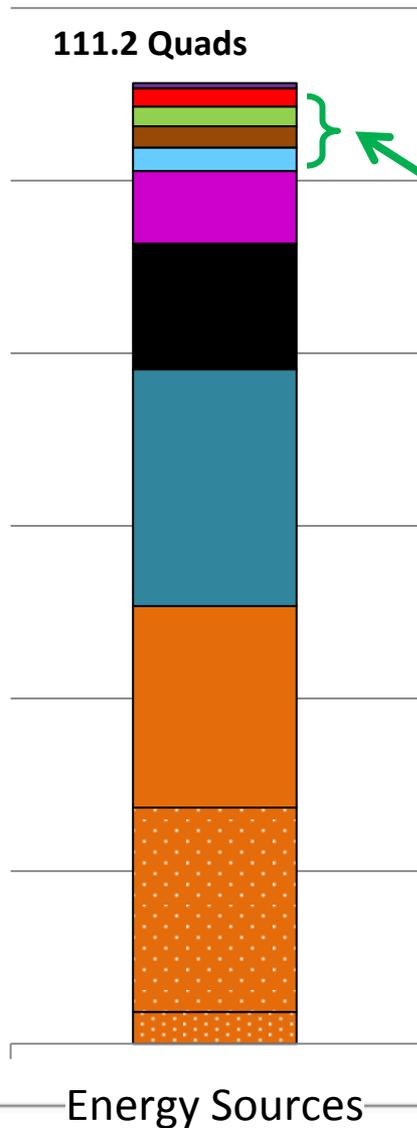

What is the status of our "Nuclear Fuel reserves"?

Minimal on a global scale & trends are all down.

Do we have the capability/capacity to generate "nuclear electricity" to export to the N. American grid?

No, unless we can ramp up the approval and construction processes.

# America's Energy Resources & Dominance

- Solar
- Wind
- BioFuels
- Wood/Waste
- Hydro/Geo

- Nuclear
- Coal
- Nat Gas
- Oil
- Oil-Import
- Misc HC Imports

## Can America Dominate Renewable Energy?

Do we meet our current domestic demand?

What are the impact of renewable energy impacts?

Do we have the capability/capacity to generate "renewable electricity" to export to the N. American grid?

No, Domestic "demand" for renewables is a "marketing manufactured" demand.

????

# Renewable Energy Impacts

## Visual Effects

- Hydro Electric – Close to maximized – more dams are not tolerated and efficiency gains often can not justify the cost to replace inefficient turbines.
- Wind turbines must be in exposed areas = highly visible. They are considered unsightly by many people, and concerns have increased with the larger size of new generation turbines.

## Noise

- Wind turbines produce aerodynamic noise, from air passing over the blades and mechanical noise from the moving parts of the turbine, especially the gearbox. Better designs have reduced noise, and research continues. Wind farms developed far from highly populated areas are, by definition, less offensive....to the people who do not live there.

## Electromagnetic Interference

- Wind turbines may scatter electromagnetic signals causing interference to communication systems. Appropriate siting (avoiding military zones or airports) can minimize this impact.

## Gulf of Mexico Hypoxia Zones

- Summer of 2017 largest ever – due in part to run-off from farms in the drainage . Coincidence with corn ethanol production? – Possibly.

## Bird Impacts

- Birds get killed when they collide with the rotating blades of a turbine. Migratory species are at higher risk than resident species. Siting the turbines away from migratory routes reduces the impact. What would happen if “Big Wind” were treated like “Big Oil”?

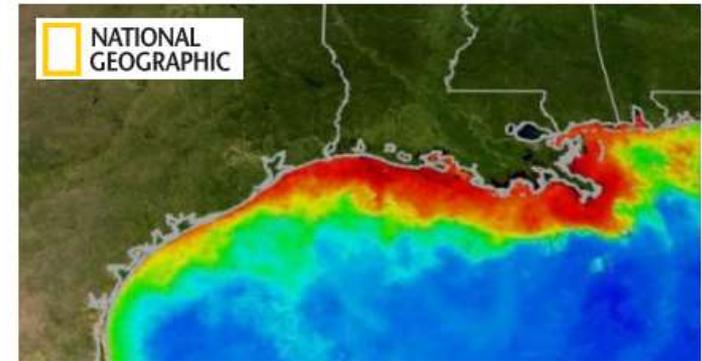

# Record Hypoxia = F(Temps, Weather & “Plankton Food”)

As we generate more “renewable ethanol” we also generate more “Hypoxia Food” that leads to increased size Dead Zones in the Gulf of Mexico.

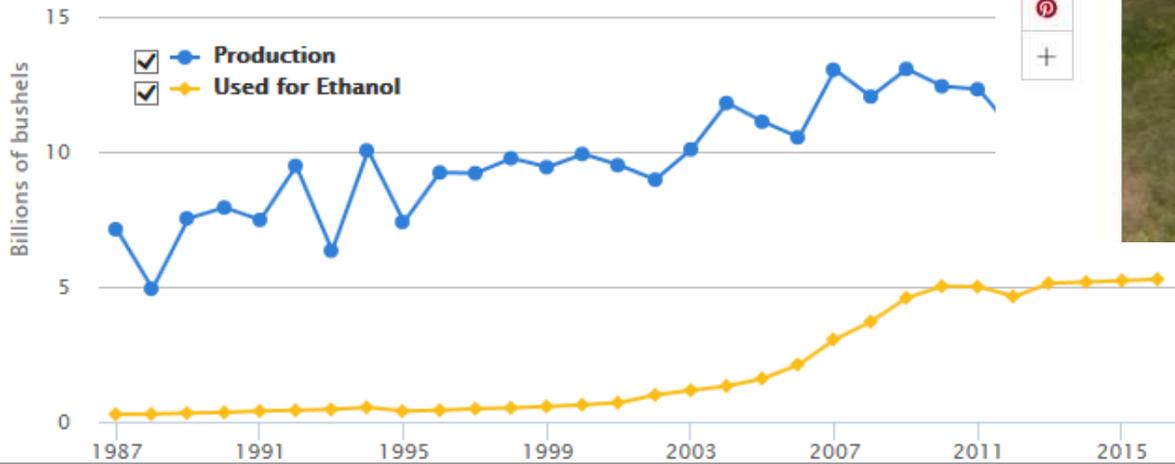

Do we really want to add “nutrients” to our oceans to adsorb CO2 and increase the size of our dead zones?

## New Jersey-Size 'Dead Zone' Is Largest Ever in Gulf of Mexico

Scientists report the latest data from the Upper Gulf of Mexico, and the results aren't good

U.S. Total Corn Production and Corn Used for Fuel Ethanol

**USDA** **United States Department of Agriculture**  
**National Agricultural Statistics Service**

**USDA Reports Record High Soybean Acreage, Corn Acres Down**

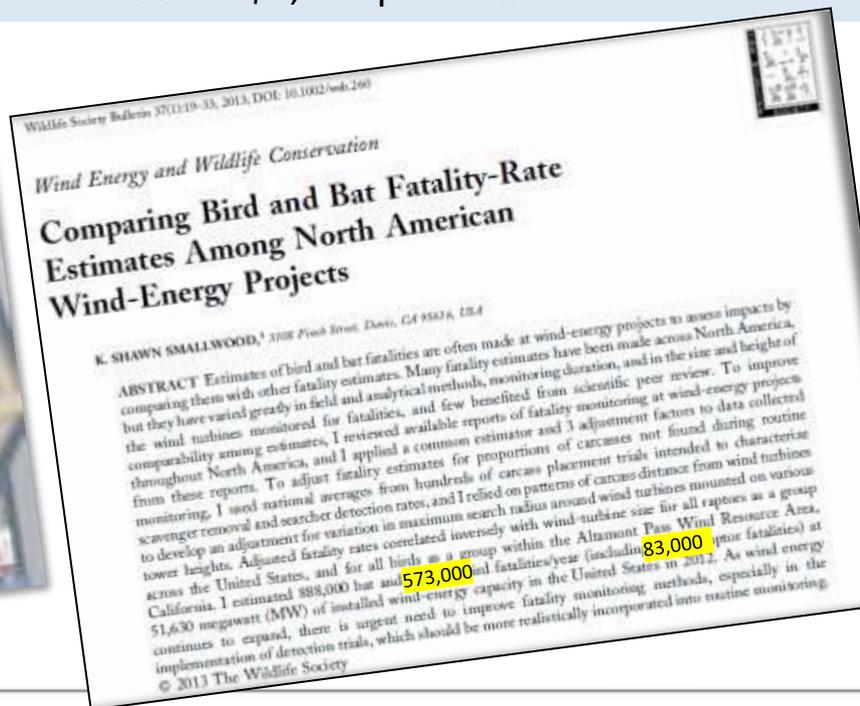

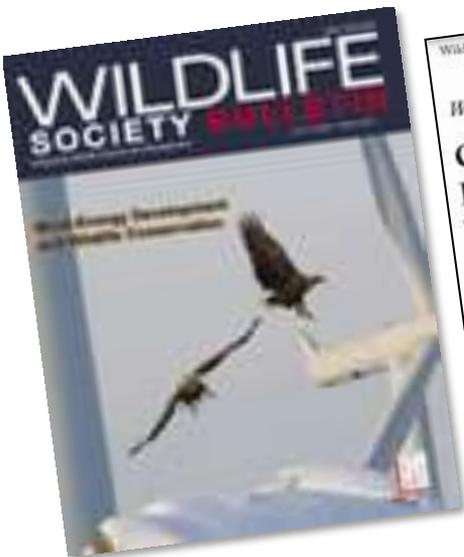

WASHINGTON, Jun. 30, 2017 – The U.S. Department of Agriculture’s National Agricultural Statistics Service (NASS) estimated a record high 89.5 million acres of soybeans planted in the United States for 2017, up 7 percent from last year, according to the Acreage report released today. Corn area planted is estimated at 90.9 million acres, down 3 percent from

# Wind Energy Impacts – Bird Fatality

Perception: Oil and Gas operations are not held to tough environmental standards

Reality: We are held to tough environmental as should all industries but other energy industries are treated differently, ex Wind Energy

[Exxon Mobil](#) agreed to pay \$600,000 in penalties after approximately 85 migratory birds died of exposure to hydrocarbons at some of its natural gas facilities across the Midwest, over a 5 year span . The fine amounts to about \$7,000 per dead bird. *New York Times 4-13-09*

If the Wind Industry (operating in the same footprint) were held to the same standard, their 83,000 raptor fatalities each year would generate fines of 581 million \$/yr, and the 573,000 total bird kill for 2012 would yield 4.01 billion \$/yr

# Renewable Energy - Quick Look at Nirvana – The Elec Car!

- Perception – Electric Cars use less energy and have no emissions.
- Perception – if “critical production mass” and an adequate recharging network established Electric Cars will be the future.
- What is the reality?

I charge my car, pay the bill & drive with no CO2 emissions! Yeay!!!

Where does the electricity come from?  
The wall outlet!

The wall outlet gets electricity from ....the power plant

The power plant gets fuel from the well or the mine.

Fossil Fuel or Nuclear

Refinery or Gas-to-Liq

So how is an Elec Car better in terms of CO2 or \$ from my current car?

# Let's Look at the US Avg – Electric Vehicle CO2 “Budget”

Power mix assumptions.  
Maxed out on Nukes & Hydro.

New energy will come from both  
conventional & renewables (i.e. subsidies  
continue).

How much CO<sub>2</sub> will be generated  
to get those electrons (KWHrs) to  
my house or charging station?  
(IPCC & EIA)

For the average driver in the  
USA, Do I trade in my 35  
MPG Accord for a Tesla  
Model 3 to reduce CO<sub>2</sub>?

United States						
Fuel Type	USA Elec Power Mix	Growth? Yes No	Used for Future Elec Vech?	Lbs CO <sub>2</sub> /KWH	5.5% Incl Trans Loss	Wgtd Avg Lbs CO <sub>2</sub> /KWH
Coal (HC)	30.4%	Yes*	30.4%	3.03	3.20	1.319
Large Hydro	6.5%	No				
Natural Gas (HC)	34.1%	Yes	34.1%	1.21	1.27	0.589
Nuclear	19.7%	No				
Oil (HC)	0.9%	Yes	0.9%	2.28	2.41	0.029
Renewables	8.4%					
Biomass	1.5%	Yes	1.5%	2.74	2.89	0.059
Geothermal	0.4%	Yes	0.4%	0.14	0.15	0.001
Solar	0.9%	Yes	0.9%	0.15	0.16	0.002
Wind	5.6%	Yes	5.6%	0.04	0.05	0.004
Total	100.0%		73.8%			<b>2.002</b>

**NO!**

I will put more CO<sub>2</sub> into the atmosphere,

Pay more in the total cost of ownership

And wait longer to “fuel” my vehicle.

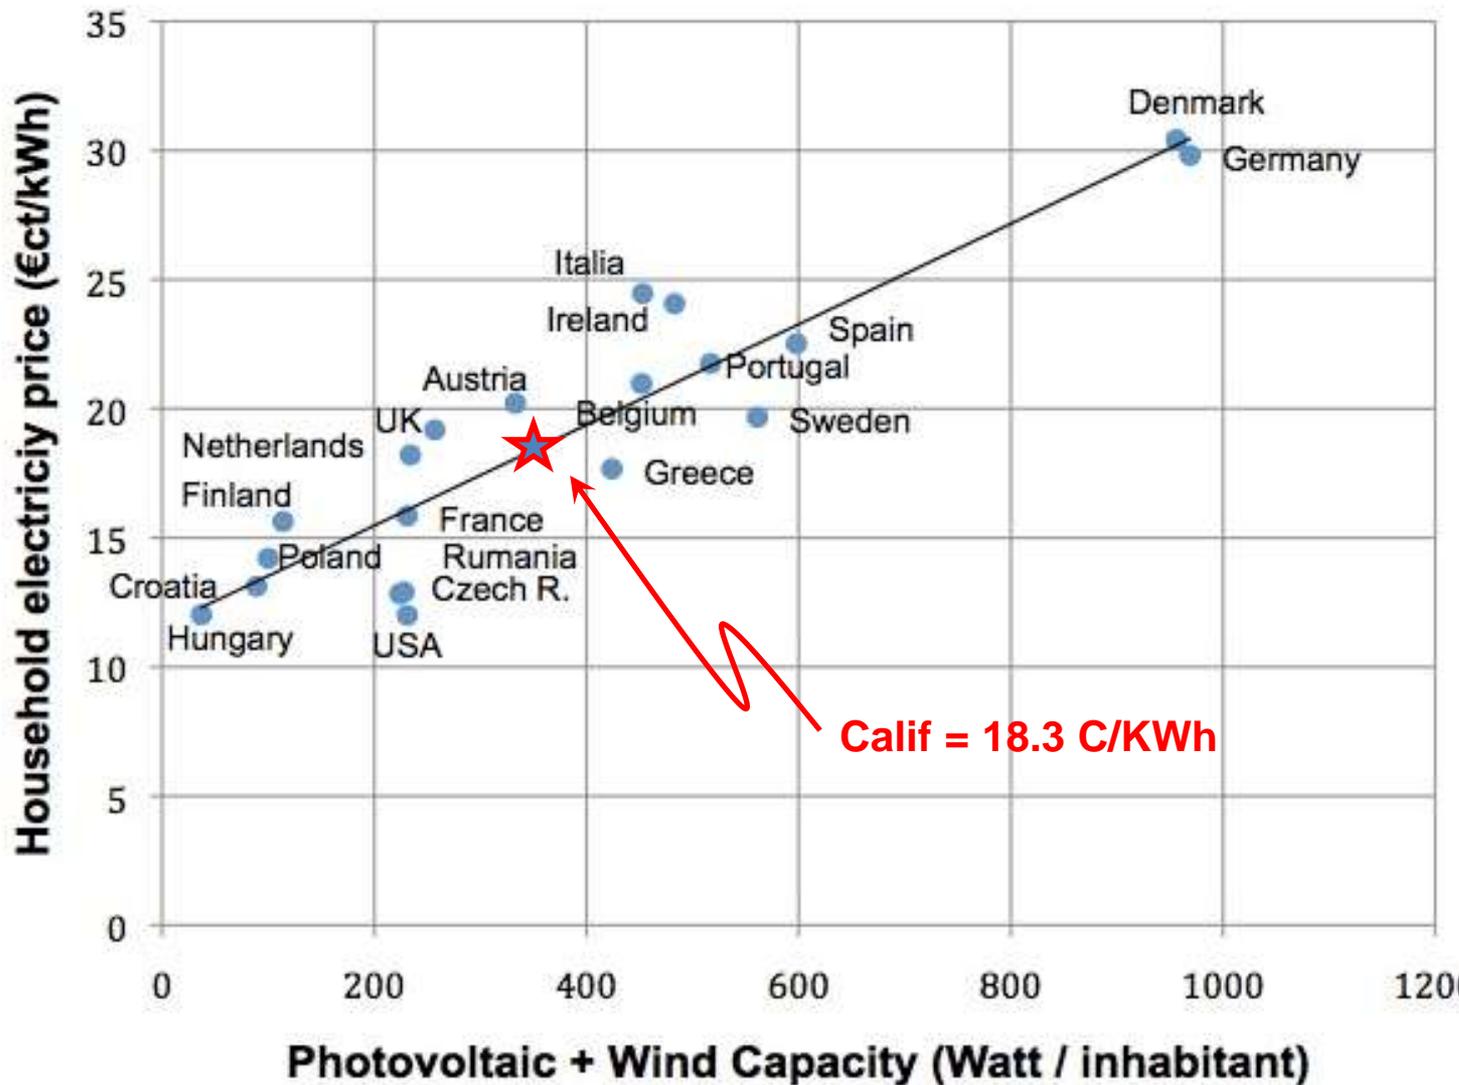

Average US Power Grid					
Miles Traveled	Charge Time (Hrs)	kWh	2.002 Lbs CO <sub>2</sub> Per KWH	Gasoline 35 MPG 19.6 PPG	% Less CO <sub>2</sub>
	50	1.7	16.6	33.3	28.0
100	3.5	33.3	66.6	56.0	-16%
150	5.2	49.9	99.9	84.0	-16%
200	6.9	66.6	133.3	112.0	-16%
250	8.7	83.2	166.6	140.0	-16%
300	10.4	99.8	199.9	168.0	-16%

The electricity that comes out of the wall in the USA averages 2.0 lbs of CO<sub>2</sub> per KWH.

If I believe I need to reduce my carbon footprint to “Save the planet” then I should focus on efficiency and not drive around in an electric car.

@ 60 MPH Charge time = 2x Drive Time

# Impact to Consumers – The High Cost Road to Renewables

Should the USA “Dominate” an energy source that is costly, inefficient, and poses surge, transfer and load shedding issues that result in the actual power supplied equal to only a fraction of the “name plate capacity”?

ANSWER: NO, Be a strategic follower not a leader in renewables

# Disclosure: I am a unconventional energy user

I have solar water heat (pool) and solar panels for electricity.

Solar water heater for the pool = No brainer.

Solar Electricity Panels in forested South Louisiana = Total Loser

Solar Panels – Payout – 21 yrs. even with an 80% discounted after tax cost.

- ✓ I firmly support unconventional/"green" energy where it works on it's own merits without any subsidies.
- ✓ But thanks to all the taxpayers in the room for my subsidies.

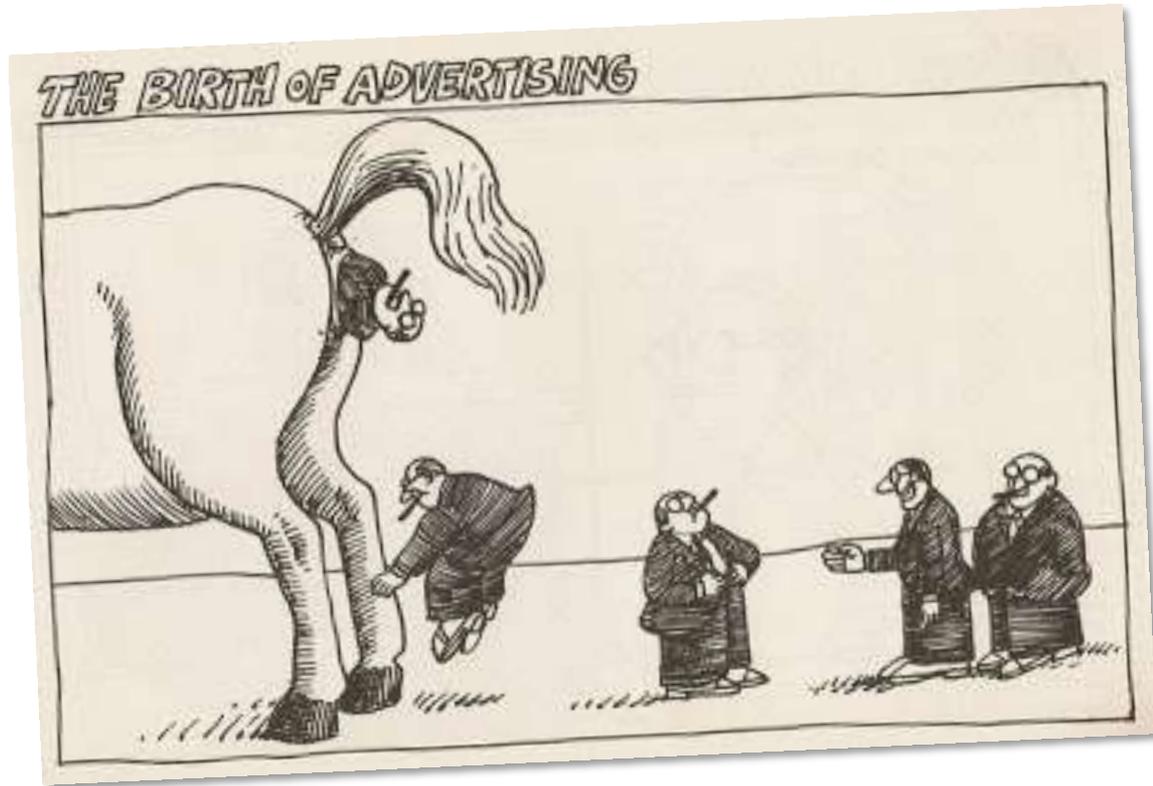

# Renewable Energy / "CO<sub>2</sub> Fear" – Dominated by Media/Advertising

What is the percentage of carbon in sucrose?

Element	Symbol	Mass Percent
Hydrogen	H	6.478%
Carbon	C	42.106%
Oxygen	O	51.415%

WOW! Domino is marketing sugar with no carbon, leaving only Hydrogen and Oxygen .....powdered water?

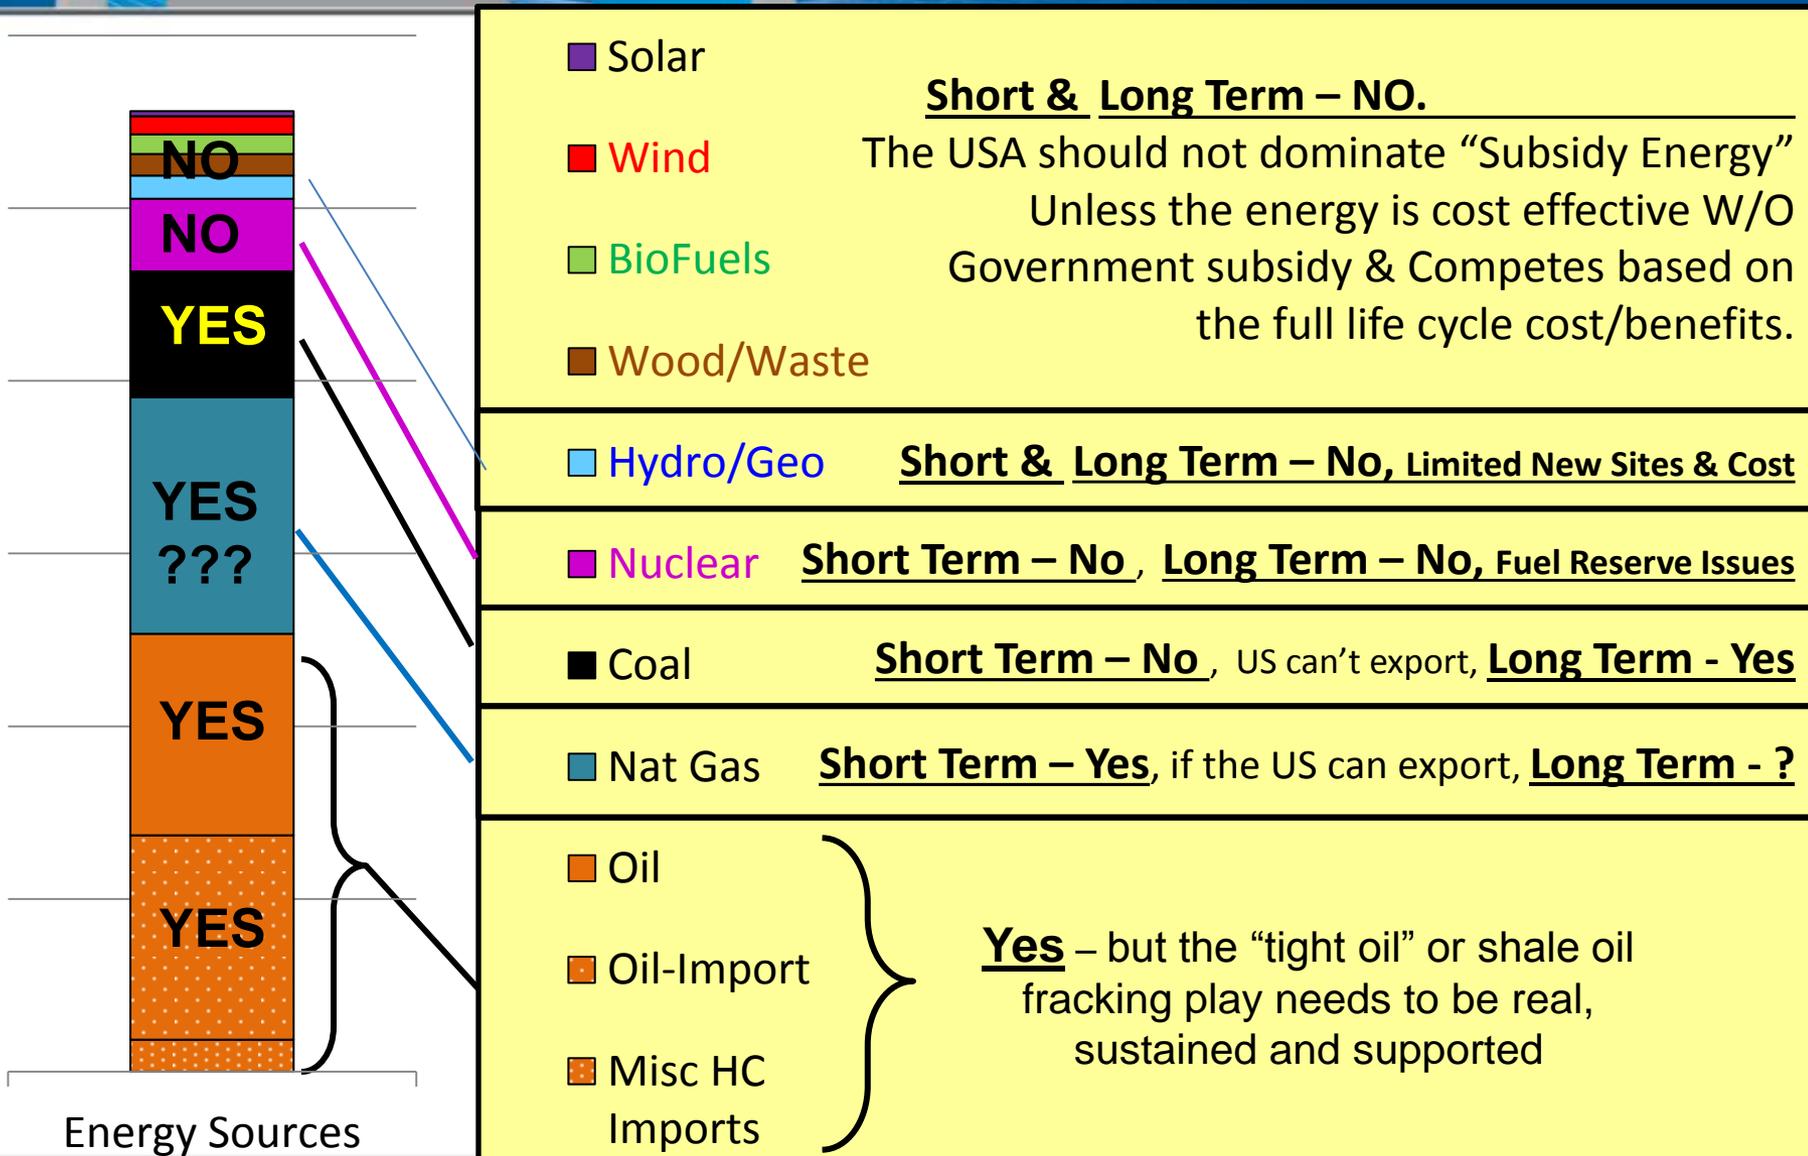

To survive long term, renewables simply need to compete on the open energy market.

# Can the US Dominate Energy?

- US Energy Overview –  
Where do we get energy, how do we use energy?
- Review the Trump Administrations Energy Goals & Strategy – to date.
- What does it mean to “DOMINATE” energy?
- SWOT Analysis – Strengths, Weaknesses, Opportunities & Threats Analysis of America’s ability to “DOMINATE” energy.
- ➔ • Answer the question, Can the US dominate Energy for each source, Oil, Natural Gas, Coal, Nuclear, Renewables.

# America's Energy Resources, Y/N Dominance Scorecard

# USA Energy DOMINANCE?

Questions?

Yes..... If all energy  
competes in open markets.

# BACK-Up Slides

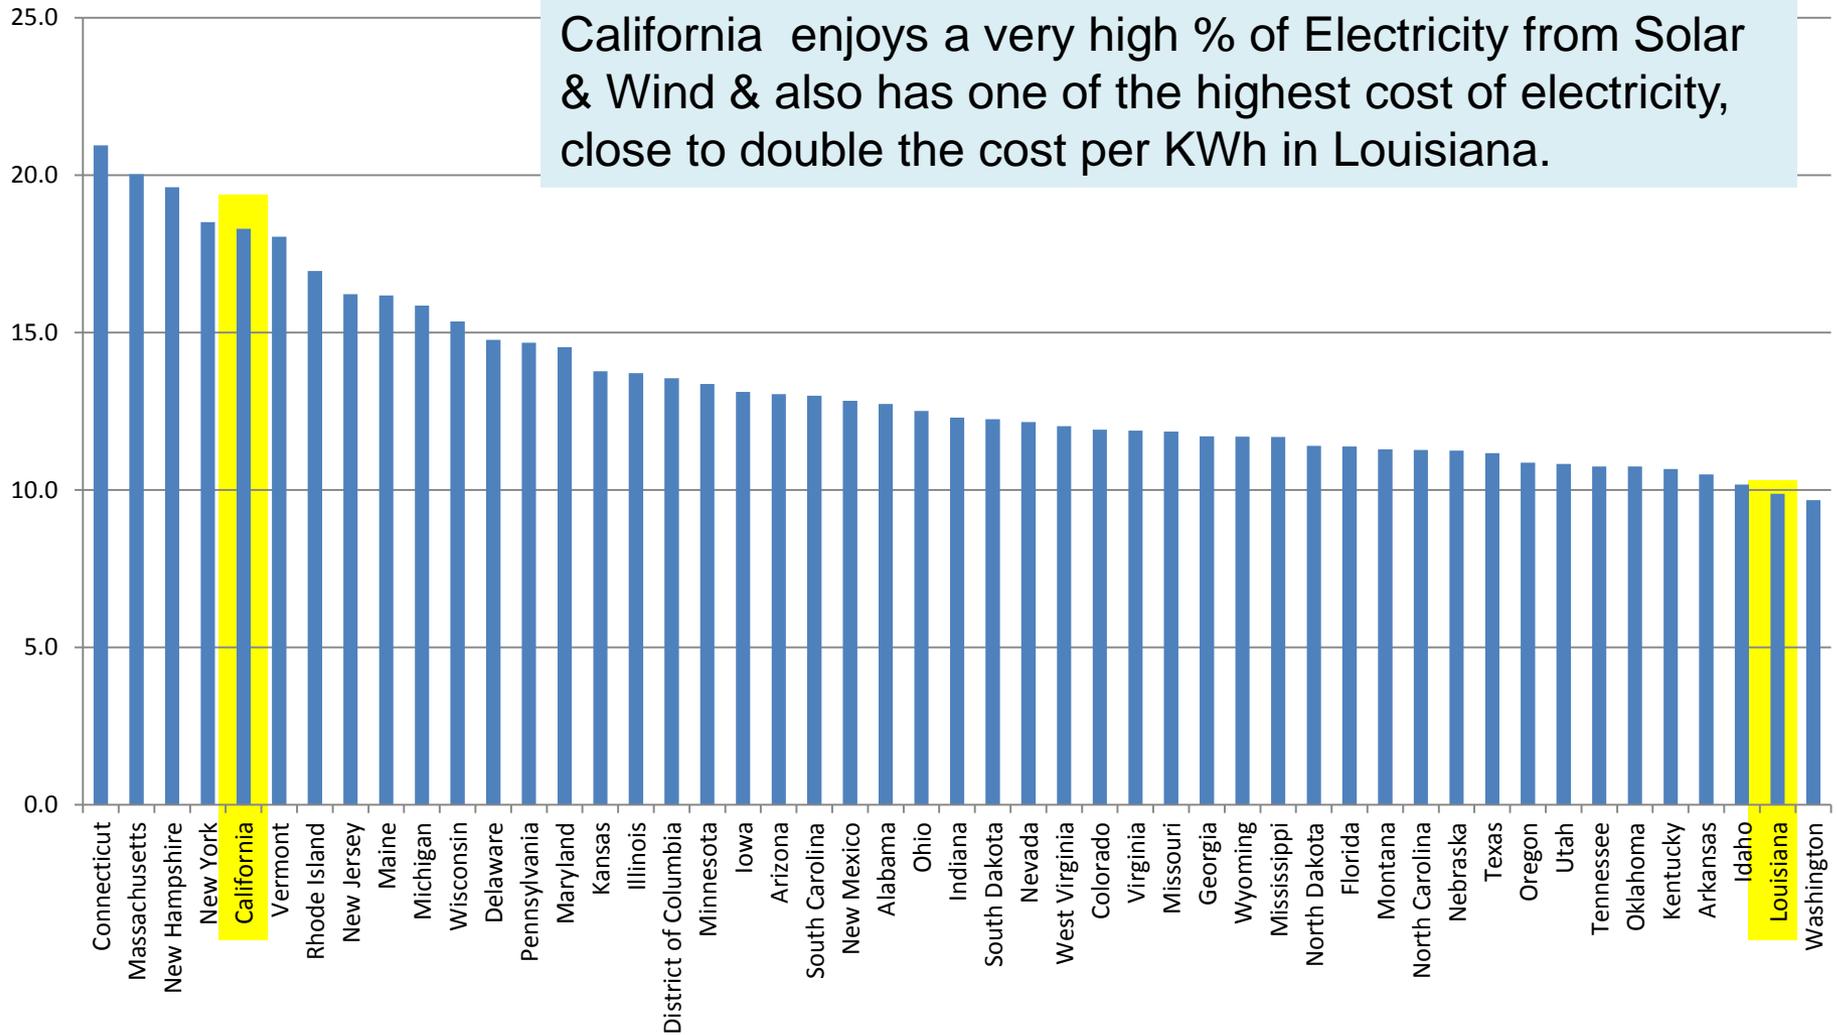

# Why can't we all "be like California"?

California Energy Budgets Estimates 2015				2015		
Category	Form	Use	California Energy Est - Trillion Btu		Imported %

Source: EIA <http://www.eia.gov/state/?sid=CA>

Answer – Every State can not “import” 2/3 of their energy.

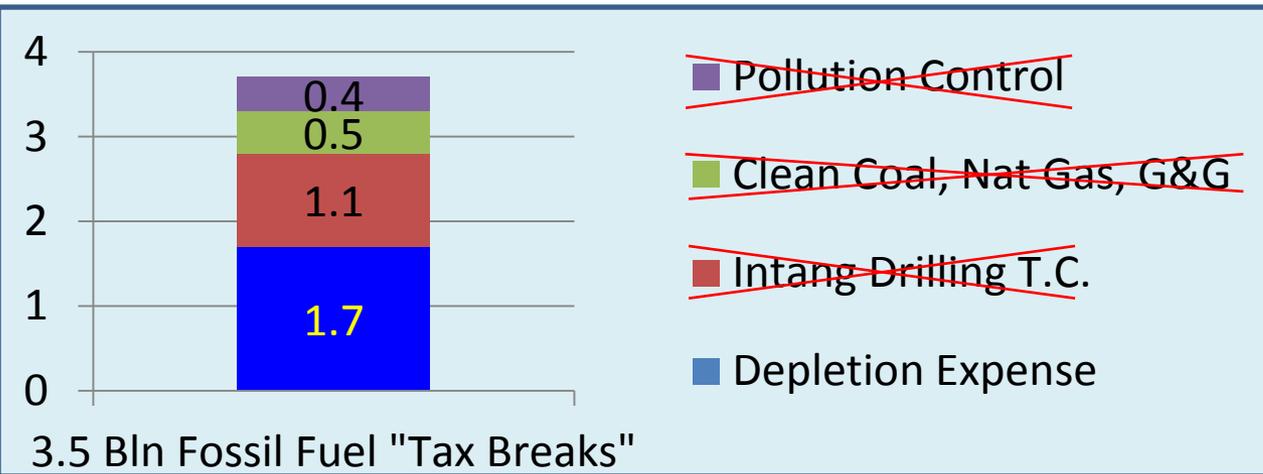

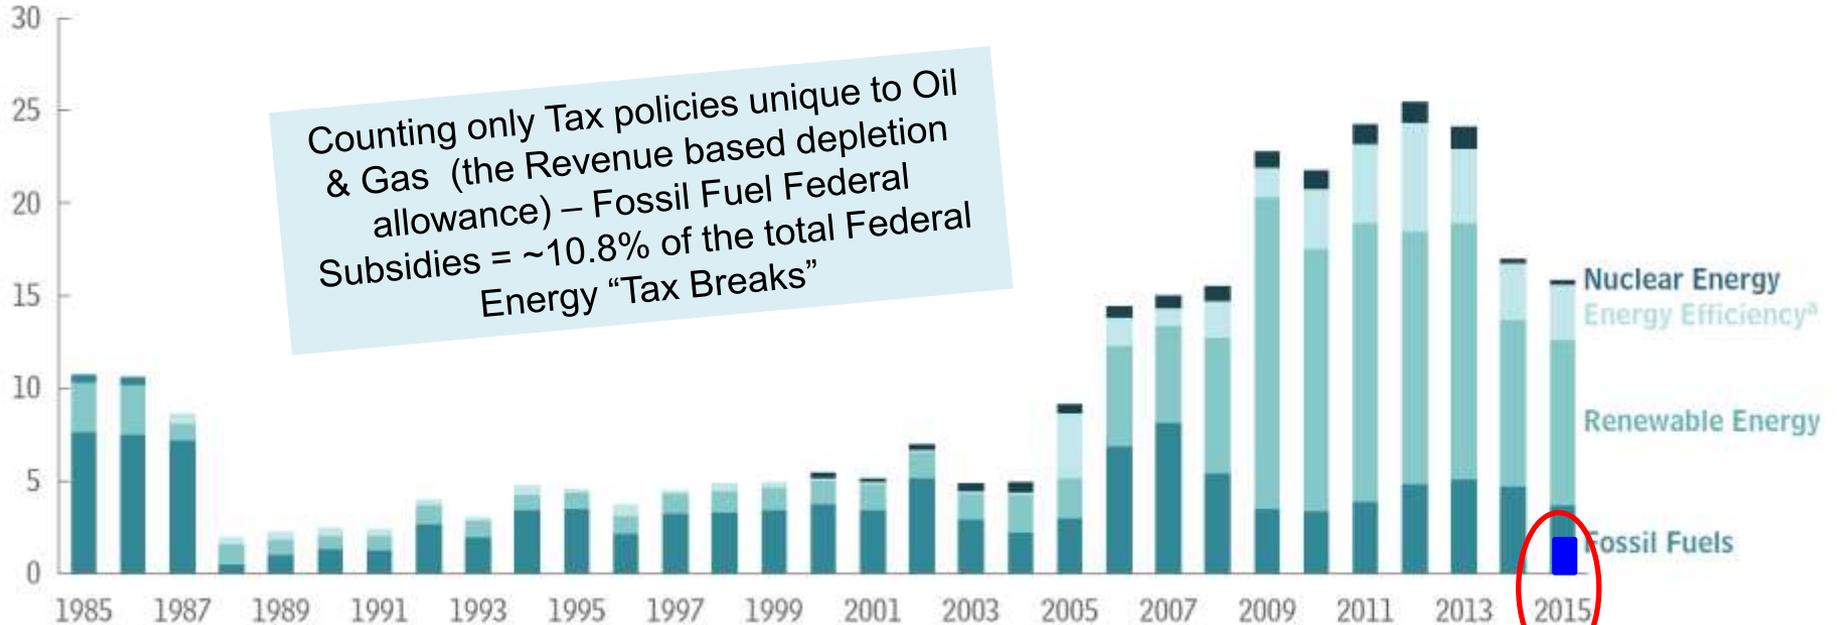

# May 2017 US Electricity Price C/KWh by State

# Federal Energy "Tax Breaks"

## Costs of Energy-Related Tax Preferences, by Type of Fuel or Technology, 1985 to 2015

Billions of 2015 Dollars

# Let's Look at the Calif – Electric Vehicle CO<sub>2</sub> & \$ "Budget"

If we use more electricity in our cars where will those electrons come from?

- Import more coal - Y
- More Nat Gas - Y
- More renewables - ~OK

How much CO<sub>2</sub> will be generated to get those electrons (KWHrs) to my house or charging station? (IPCC & EIA)

Do I trade in my 35 MPG Accord for a Tesla Model 3 in Calif. to reduce CO<sub>2</sub>?

Info from Tesla Website, My Tesla Model 3 needs 16.6 KWH of electricity to go 50 miles.

To get that 16.6 KWH in Ca 21.6 Lbs of CO<sub>2</sub> will be produced.

Fuel Type	Ca	% of Ca	Imported	Ca Energy Mix (GWh)	Ca Power Mix	Growth? Yes/No	Used for Future Elec Vech?	Lbs CO <sub>2</sub> /KWH	9%	Wgtd Avg Lbs CO <sub>2</sub> /KWH

Miles Traveled	Tesla 3 Charge Time (Hrs)	Tesla 3 "Fuel" kWh	1.3 Lbs CO <sub>2</sub> Per KWH	Gasoline 35 MPG 19.6 PPG	% Less CO <sub>2</sub>
	50	1.7	16.6	21.6	28.0
100	3.5	33.3	43.3	56.0	29%
150	5.2	49.9	64.9	84.0	29%
200	6.9	66.6	86.5	112.0	29%
250	8.7	83.2	108.2	140.0	29%
300	10.4	99.8	129.8	168.0	29%

@ 60 MPH Charge time = 2x Drive Time

If I can get 35 MPG in my Honda Accord I will use 1.4 gal of gas and put 28 lbs of CO<sub>2</sub> into the air.

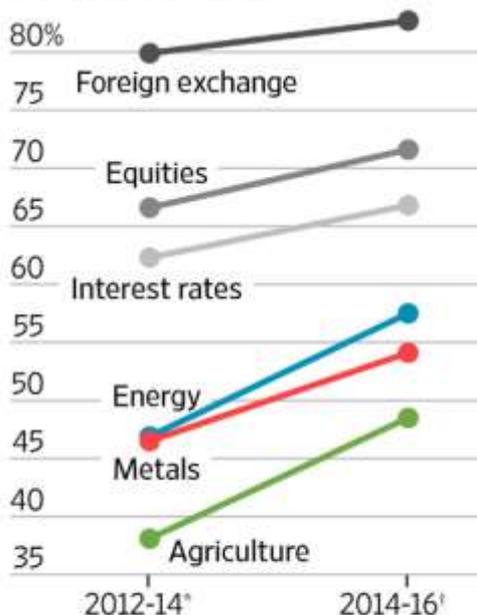

The electricity that comes out of the wall in Ca adds 1.3 lbs of CO<sub>2</sub> per KWH?

If I live in Ca and I want to reduce CO<sub>2</sub> then.....yes ....I trade in my Honda for a Tesla If I have the time and the \$\$.

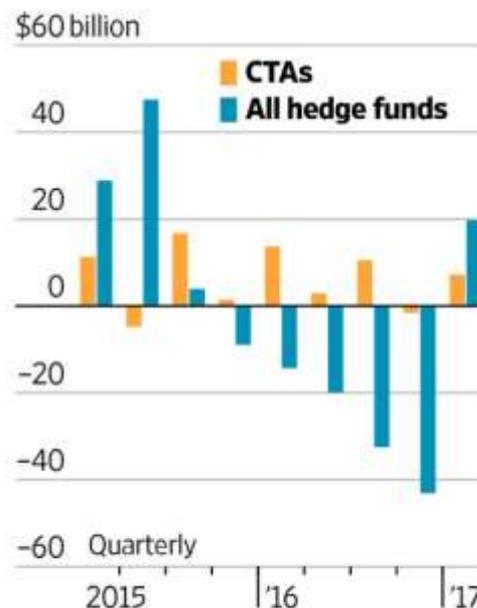

## Computerized Commodities

Automated trading is becoming more popular in markets like energy, metals and agriculture. That's helping fuel investments into commodity trading advisors (CTAs), hedge funds that often use computer programs to bet on market trends.

# EVs Vs MVs

- Disclaimer: I am a Space x and Tesla fan. Unlike normally funded government programs, Elon Musk has demonstrated that you can run a company entirely on government subsidies and actually produce something useful (but not for profit).
- Myth: Electric vehicles will overtake the motor vehicle market by 2030
- Truth: Data suggests that EVs are not yet competitive. We will use Tesla information because they are truly the EV market leader.
- Using Telsa's website: <https://www.tesla.com/charging>. We can develop a table to more easily understand what the Model 3 claims, I adjusted a few variables to make this work for a 2017 Honda Accord Comparison

NEMA 14-150		\$/kWh	mpg	\$/gal
9.6kW		0.12	27	2.34
	Charge			
Miles Traveled	Time (min)	kWh	eCost	gCost
50	104	16.64	\$ 2.00	\$ 4.33
100	208	33.28	\$ 3.99	\$ 8.67
150	312	49.92	\$ 5.99	\$ 13.00
200	416	66.56	\$ 7.99	\$ 17.33
250	520	83.2	\$ 9.98	\$ 21.67
300	624	99.84	\$ 11.98	\$ 26.00

# EVs Vs MVs

- At a first glance the data looks great! Tesla will save the average car driver at least 50% in energy cost!
- Lets take a look at life cycle cost. Side by side lowest Model 3 base vs Honda Accord base:

2017 Honda Accord Sedan		Tesla Model 3	
MSRP	\$ 22,500.00	MSRP	\$ 35,000.00
mpg City	27	mpg City eq	59
Range miles	459	Range miles	200
Fill up time	15 min /4 59 mile	Charge time	2 min / mile

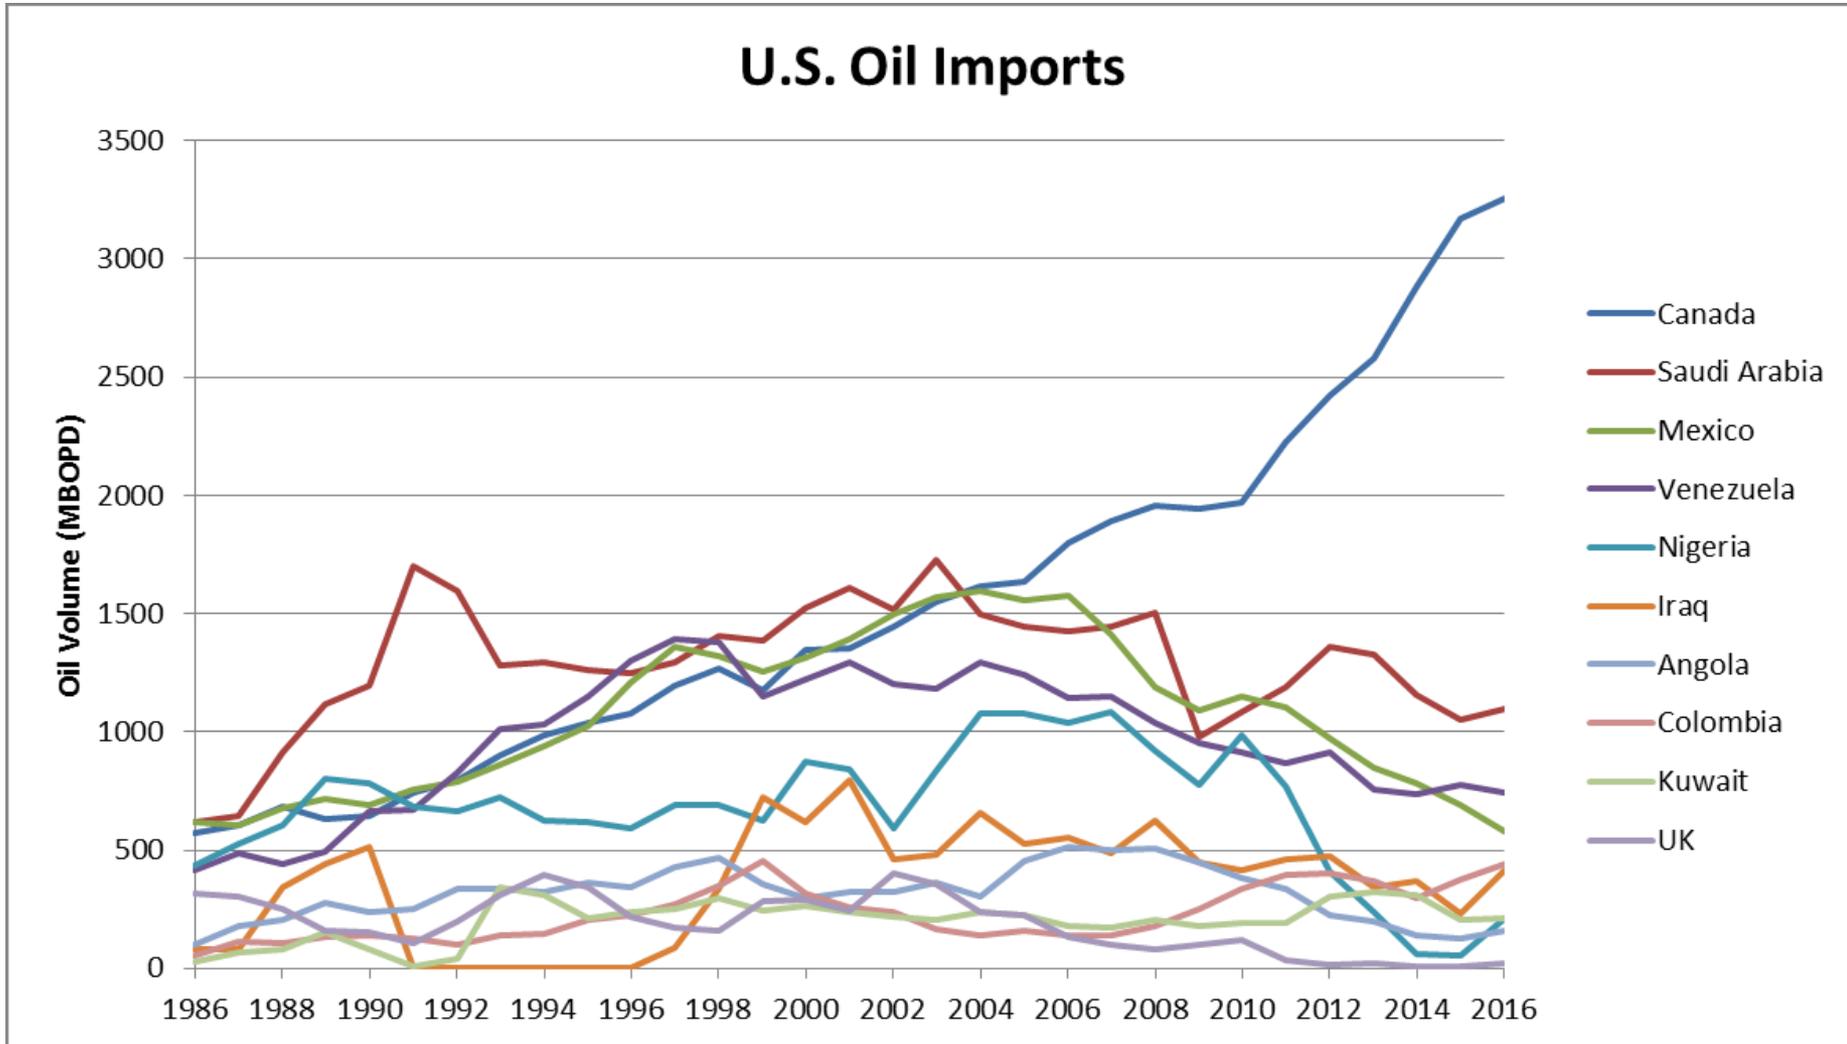

- mpg equivalence was calculated as follows:  
$$(\text{mpg Honda Accord}) * (\text{gCost} / \text{eCost})$$
- Now we can do a NPV equivalence based solely on mileage. How many miles do I have to drive to a Tesla Model 3 to actually save money assuming I pay for either vehicle in full on day 1? Using an interest rate of 4% APR and driving an average of 88 miles a day or 30,000 miles per year.

## 362,500 miles before I Break Even

# EVs Vs MVs

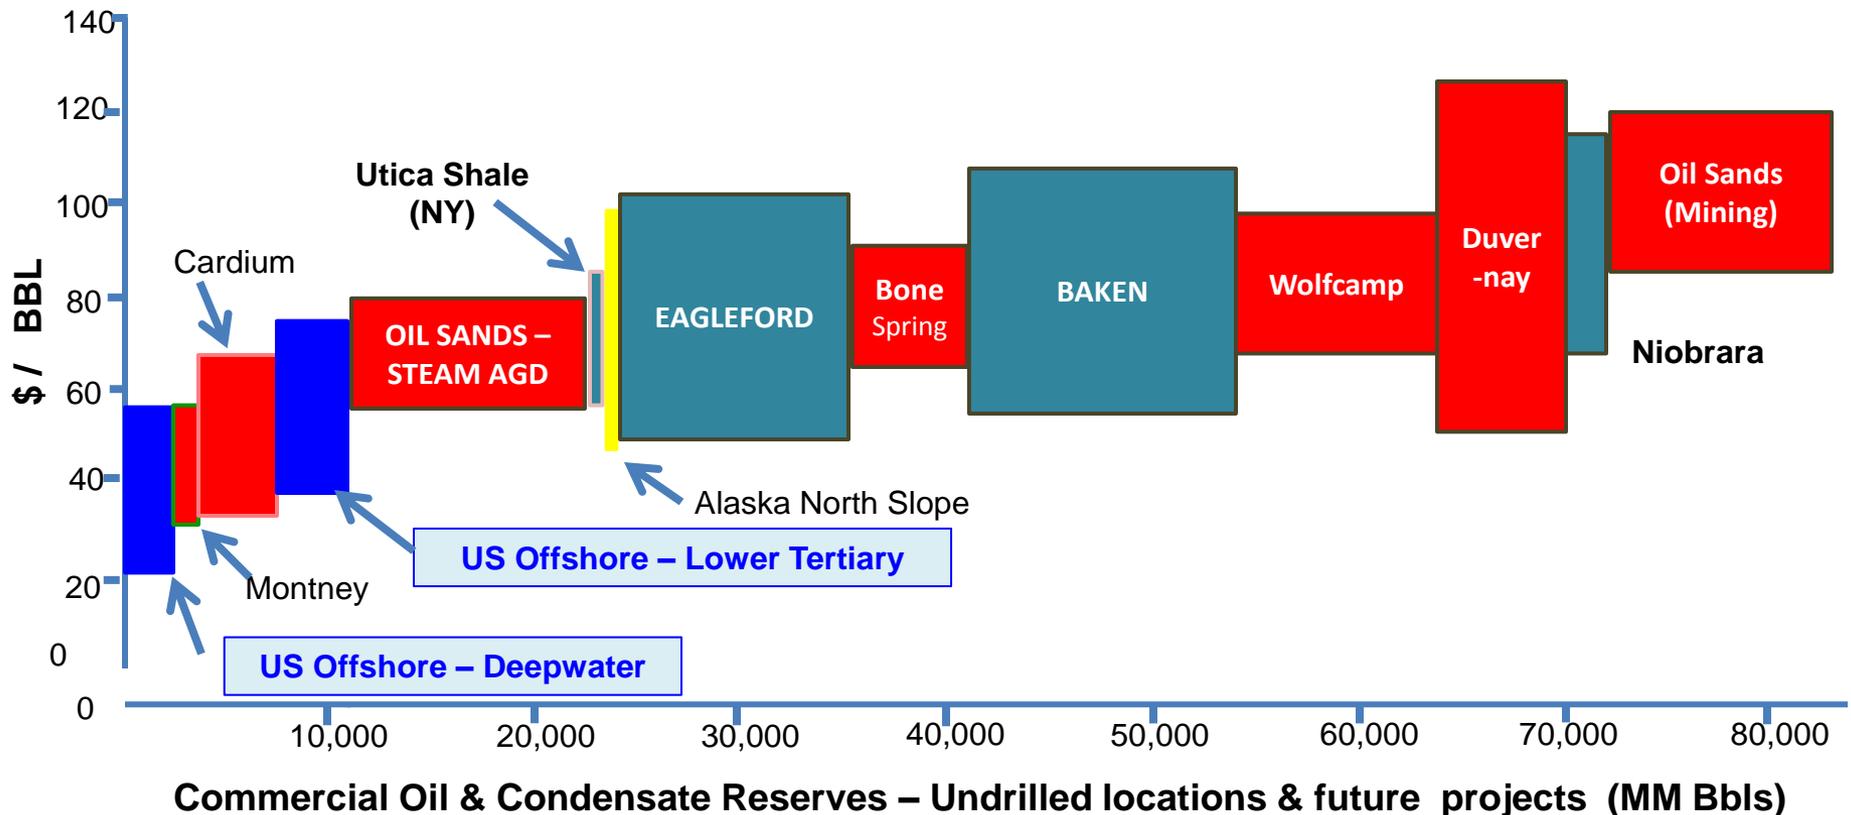

- Ok so I lose money. The Tesla is still cool and I still want one. Lets look at other stats:
- The base model S will take me 7 hours to charge from a full drain on my normal house charger. I could upgrade to the \$45,000 model and get 300 miles per charge but that will take 10 hours.
- Supercharging stations exist in my state. This will come in handy, 30 minutes for 170 miles! Great improvement.
- Supercharging station density: 6 in Louisiana.
- There are at least 6 gas stations within 2 miles of my house. And I can get a beer there. I wish I had auto pilot but I can wait 2 miles to open it.

# US Oil Import Trends

# DW Gulf of Mexico – The most profitable play in N America

## NORTH AMERICAN BREAKEVEN OIL PRICES

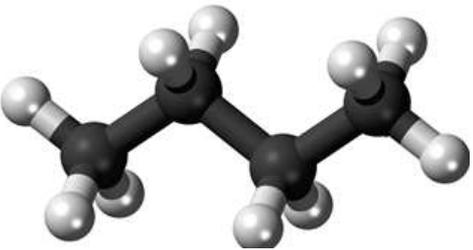

Deepwater is the most competitive in terms of profitability, but as per Wood MacKenzie is not as large as other opportunities. **True or False?**

# Hydrocarbon Basics & the Value of US Light “Crudes”

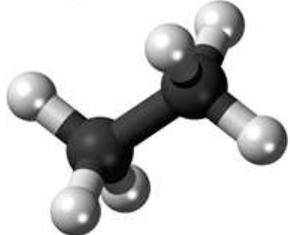

Methane CH<sub>4</sub>

“Crude Oil” is a crude mixture of hydrocarbon chains from Methane (1) to Tetractane (40)

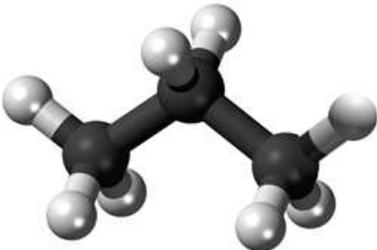

Butane C<sub>4</sub>H<sub>10</sub>

Ethane C<sub>2</sub>H<sub>6</sub>

Pentane C<sub>5</sub>H<sub>12</sub>

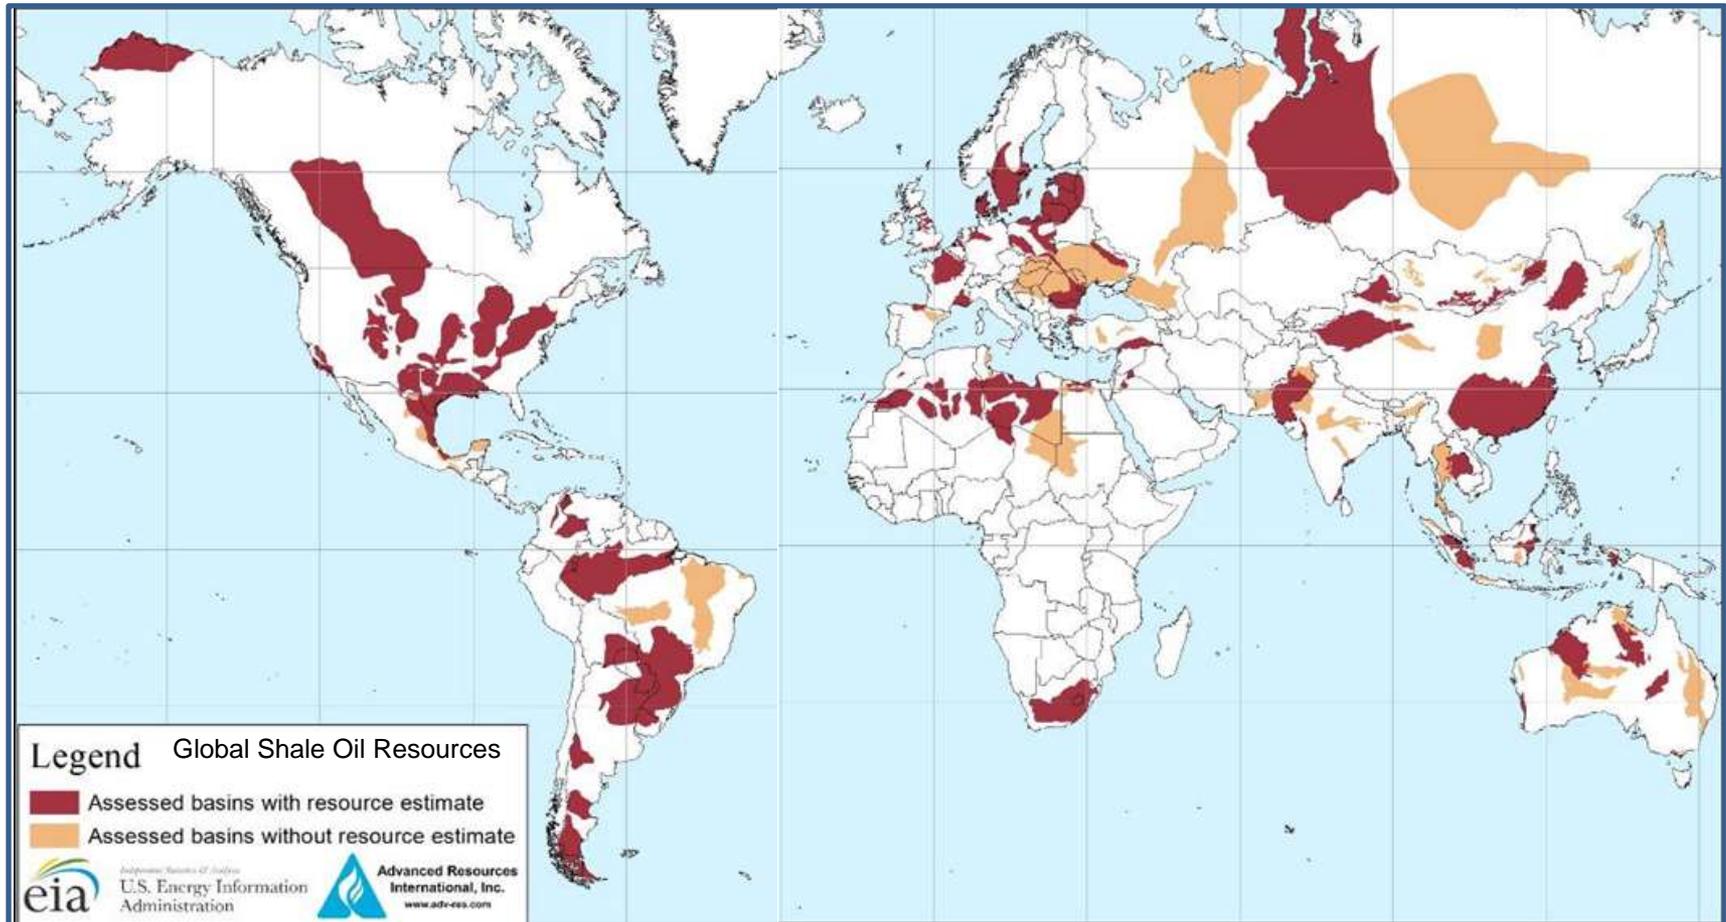

Propane C<sub>3</sub>H<sub>8</sub>

Light weight Crudes and Condensates are blended with Heavy Crudes for ease of transport, refining yields and overall utility of the final oil mixture.

US Crudes from the GOM along with condensates and the very light “Shale Oils” are ideal for blending with heavy crudes in Canada and S America..

# What if....the rest of the world starts Fracking?

- Potential US “dominance” in oil would be mitigated by similar shale oil developments on a global basis.
- Possible – Yes. Likely - No

# Why the USA is the Fracking leader and is likely to continue.

- The USA mineral rights/ownership model is unique in the world. In virtually all countries around the world, the owner of the surface land – be it a house or farmland – has absolutely no rights with regards to mineral ownership.
- Not so in the US – Land Ownership – 61% of US Land & Minerals are privately held and the landowner/mineral rights owner owns the minerals. The individual shares in the financial returns associated with oil and gas development.
- Canada has equally impressive shale oil/gas resources, however only 9% of the Canadian mineral rights are privately held.
- With little to no financial incentive to deal with the temporary surface impacts associated with drilling and production outside the US, there is also relatively little global support for fracking and oil and gas development.
- The mineral rights structure in the US supports a diverse range of oil and gas companies that work in competitive as well as a complimentary modes. Outside the US the oil and gas industry is dominated almost entirely by large corporations and national oil companies.
- The end result is the US enjoys the most diverse, efficient and safe oil and gas industry in the world.
- Rotary drilling on land & offshore drilling started and remain to a large degree US based\*. The Fracking revolution will follow the same US led path.

Thus, a reserves position based on onshore fracking is likely to remain a globally competitive advantage for the US.

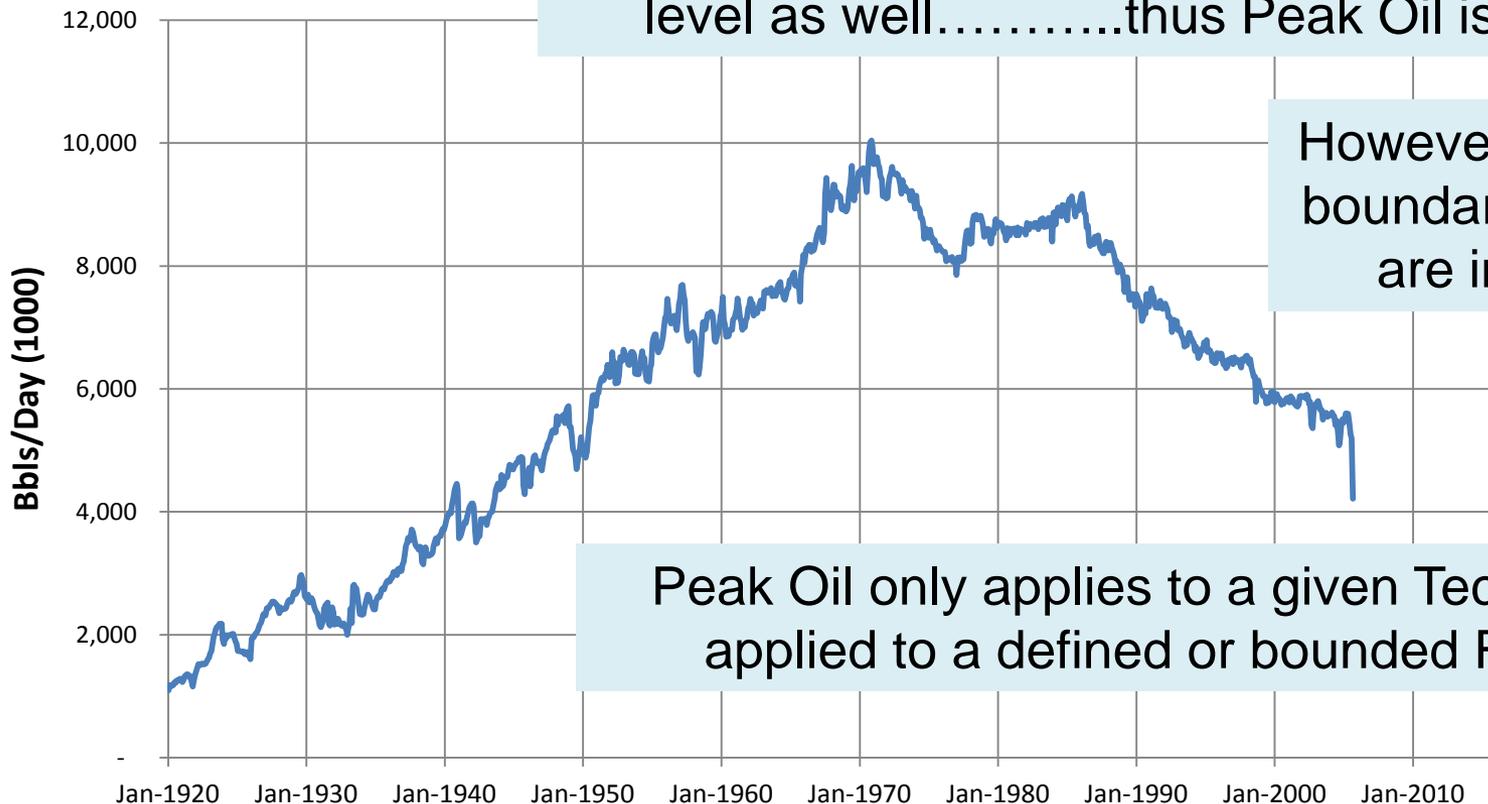

# FINALLY - Peak Oil – FACT or FICTION?

**Peak oil**, an event based on M. King Hubbert's theory, is the point in time when the maximum rate of extraction of petroleum is reached, after which it is expected to enter **terminal** decline.

**Peak oil** theory is based on the observed rise, **peak**, fall, and depletion of aggregate production rate in **oil** fields over time.

The physics on a “field level” , works on a global level as well.....thus Peak Oil is a FACT.

However, in physics, boundary conditions are important.

Peak Oil only applies to a given Technology set applied to a defined or bounded Resource.

# Peak Oil – FACT or FICTION?

2XXX  
UnConventional  
Reservoir &  
New Technology  
“PEAK OIL”

# ‘NEW Technology’ PEAK OIL

**“We can only drill for what we can see, we can only produce what we can get to flow.”**

Once we have maximized both we will then truly reach PEAK OIL.

**What can we see?** – as deep and as far as the seismic will allow – which is always changing.

**What can we drill for?**

With rotary steerable computerized drilling tools and fully robotic state of the art rigs we can drill what we can see – to 40,000’. We can drill to the full range of the oil provinces in the earth.

**What can we produce** – with fracking technology we can produce significant oil from a range of resources, onshore and offshore.

ADD it all up and you have.....a different future.

## US holds more oil reserves than Saudi Arabia, Venezuela, new study shows

London (Platts)--4 Jul 2016 12:24 pm EDT/16:24 GMT

- \* Rystad study includes yet to find oil
- \* Global reserves stand at 2.09 trillion barrels
- \* Venezuela reserves well below official data

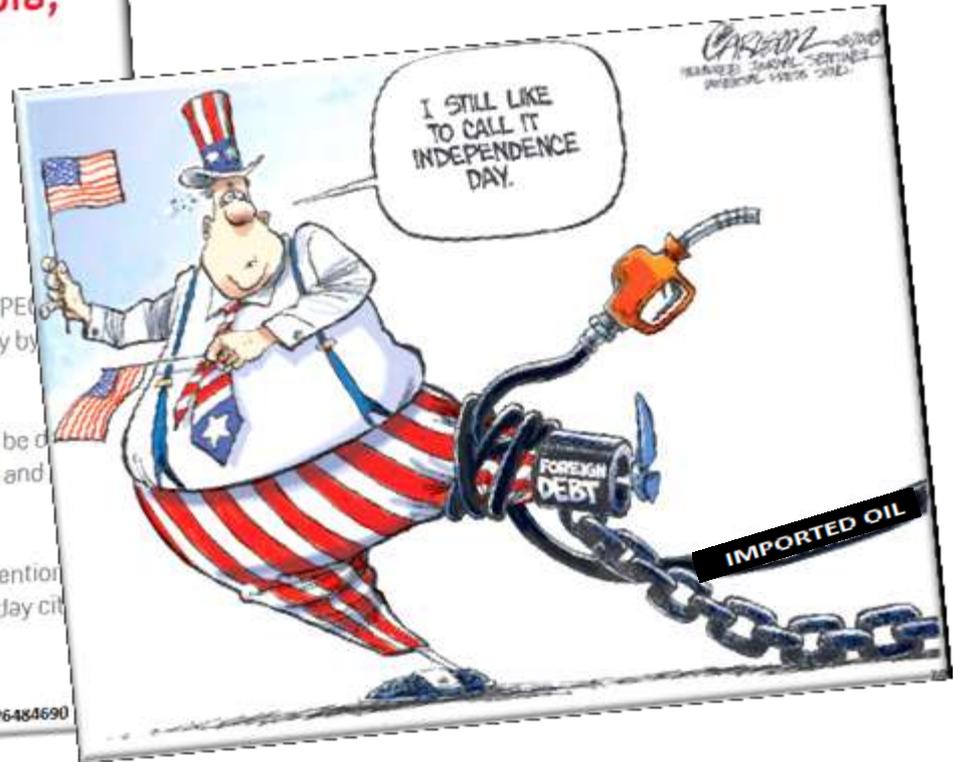

The US holds the world's biggest recoverable reserves of oil putting it ahead of OPEC Saudi Arabia and Venezuela as well as Russia, according to an independent study by Norwegian research group Rystad Energy.

In estimates which include potential reserves in recent discoveries and in yet to be discovered fields, US reserves total 264 billion barrels, ahead of 256 billion barrels in Russia and 180 billion barrels in Saudi Arabia.

For the US, more than half of the remaining oil reserves are made up of unconventional oil with Texas alone holding over 60 billion barrels of shale oil, Rystad said Monday citing new data.
